SAFETY SYMBOLS

Always follow safety instructions to prevent accidents and potential hazards from occurring.

 **WARNING**	This symbol means improper operation may results in serious personal injury or death.
 **CAUTION**	Identifies shock hazards under certain conditions. Particular attention should be given because dangerous voltage may be present. Maintenance operation should be done by qualified personnel
	Identifies potential hazards under certain conditions. Read the message and follow the instructions carefully.
	Identifies shock hazards under certain conditions. Particular attention should be given because dangerous voltage may be present.

E N G L I S H

Edition of September 2013

This publication could present technical imprecision or misprints. The information here included will be periodically modified and updated, and all those modifications will be incorporated in later editions.
To consult the most updated information of this product you might access through our website www.power-electronics.com where the latest version of this manual can be downloaded.

Revisions

Date	Revision	Description

SAFETY INSTRUCTIONS

IMPORTANT!

- Read this manual carefully to maximise the performance of this product and to ensure its safe use.
- In this manual, safety messages are classified as follows:

WARNING

Do not remove the cover while the power is applied or the unit is in operation.
Otherwise electric shock could occur.

Do not run the drive with the front cover removed.
Otherwise you may get an electric shock due to the high voltage terminals or exposure of charged capacitors.

Do not remove the cover except for periodic inspections or wiring, even if the input power is not applied. Otherwise you may access the charged circuits and get an electric shock.

Wiring and periodic inspections should be performed at least 10 minutes after disconnecting the input power and after checking the DC Link voltage is discharged with a meter (below 30VDC).
Otherwise you may get an electric shock.

Operate the switches with dry hands.
Otherwise you may get an electric shock.

Do not use cables with damaged insulation.
Otherwise you may get an electric shock.

Do not subject the cables to abrasions, excessive stress, heavy loads or pinching.
Otherwise, you may get an electric shock.

CAUTION

Install the drive on a non-flammable surface. Do not place flammable material nearby.
Otherwise fire could occur.

Disconnect the input power if the drive gets damaged.
Otherwise it could result in a secondary accident or fire.

After the input power is applied or removed, the drive will remain hot for a couple of minutes.
Touching hot parts may result in skin burns.

Do not apply power to a damaged drive or to a drive with parts missing even if the installation is complete.
Otherwise you may get an electric shock.

Do not allow lint, paper, wood chips, dust, metallic chips or other foreign matter into the drive.
Otherwise fire or accident could occur.

WARNINGS

RECEPTION

- The SD700 is carefully tested and perfectly packed before leaving the factory.
- In the event of transport damage, please ensure that you notify the transport agency and POWER ELECTRONICS: 902 40 20 70 (International +34 96 136 65 57) or your nearest agent, within 24hrs from receipt of the goods.

UNPACKING

- Make sure model and serial number of the variable speed drive are the same on the box, delivery note and unit.
- Each variable speed drive is supplied with a SD700 technical manual.

RECYCLING

- Packing of the equipments should be recycled. For this, it is necessary to separate different materials included (plastic, paper, cardboard, wood, ...) and deposit them on proper banks.
- Waste products of electric and electronic devices should be selectively collected for their correct environmental management.

EMC

- This type of PDS (Power Device System) is not intended to be used on a low-voltage public network which supplies domestic premises.
- Radio frequency interference is expected if used on such a network.

SAFETY

- Before operating the drive, read this manual thoroughly to gain and understanding of the unit. If any doubt exists then please contact POWER ELECTRONICS, (902 40 20 70 / +34 96 136 65 57) or your nearest agent.
- Wear safety glasses when operating the drive with power applied and the front cover is removed.
- Handle the drive with care according to its weight.
- Install the drive according to the instructions within this manual.
- Do not place heavy objects on the drive.
- Ensure that the mounting orientation is correct.
- Do not drop the drive or subject it to impact.
- The SD700 drives contain static sensitive printed circuits boards. Use static safety procedures when handling these boards.
- Avoid installing the drive in conditions that differ from those described in the *Technical Characteristics* section.

CONNECTION PRECAUTIONS

- To ensure correct operation of the drive it is recommended to use a SCREENED CABLE for the control wiring.
- For EMERGENCY STOP, make sure supply circuitry is open.
- Do not disconnect motor cables if input power supply remains connected. The internal circuits of the SD700 Series will be damaged if the incoming power is connected and applied to output terminals (U, V, W).
- It is not recommended to use a 3-wire cable for long distances. Due to increased leakage capacitance between conductors, over-current protective feature may not operate correctly.
- Do not use power factor correction capacitors, surge suppressors, or RFI filters on the output side of the drive. Doing so may damage these components.
- Always check whether the DC Link LED is OFF before wiring terminals. The capacitors may hold high-voltage even after the input power is disconnected. Use caution to prevent the possibility of personal injury.

TRIAL RUN

- Verify all parameters before operating the drive. Alteration of parameters may be required depending on application and load.
- Always apply voltage and current signals to each terminal that are within levels indicated within this manual. Otherwise, damage to the drive may result.

OPERATION PRECAUTIONS

- When the Auto Restart function is enabled, keep clear of driven equipment, as the motor will restart suddenly after a fault is reset.
- The “STOP / RESET” key on the keypad is active only if the appropriate function setting has been made. For this reason, install a separate EMERGENCY STOP push button that can be operated at the equipment.
- If a fault reset is made with the reference signal still present then a restart will occur. Verify that it is permissible for this to happen, otherwise an accident may occur.
- Do not modify or alter anything within the drive.
- Before programming or operating the SD700 Series, initialise all parameters back to factory default values.

EARTH CONNECTION

- The drive is a high frequency switching device and leakage current may flow. Ground the drive to avoid electrical shock. Use caution to prevent the possibility of personal injury.
- Connect only to the dedicated ground terminal of the drive. Do not use the case or the chassis screw for grounding.
- When installing, grounding wire should be connected first and removed last.
- The earth cable must have a minimal cross sectional area that meets local country electrical regulations.
- Motor ground must be connected to the drive ground terminal and not to the installation’s ground. We recommend that the section of the ground connection cable should be equal or higher than the active conductor.
- Installation ground must be connected to the drive ground terminal.

1. DISPLAY UNIT AND CONTROL KEYPAD

1.1. Keypad Unit Description

The display of the SD700 is removable for remote installation, as the illustration shows. There are three leds on the display which indicate the drive operational status, one LCD screen with 4 lines of 16 characters each and keys for control and parameter setting.

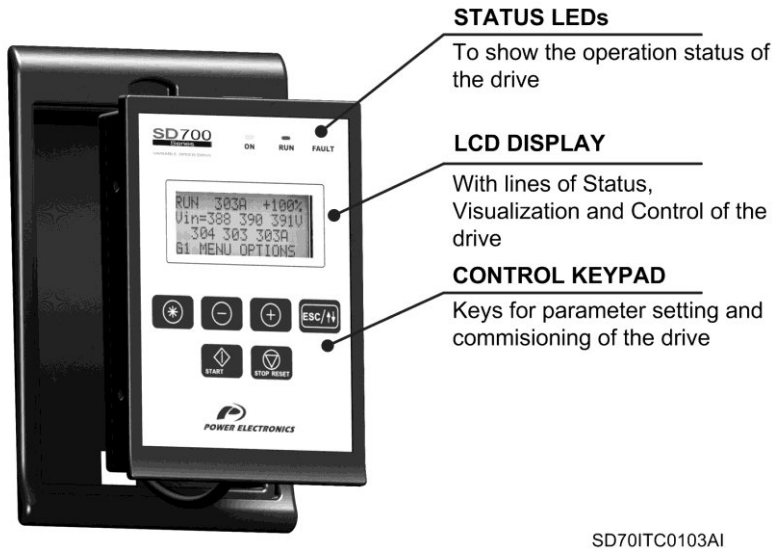

Figure 1.1 Display Unit and Keypad

1.1.1. LEDs for Status Indication

Leds offer an easy method of identifying if the SD700 is powered up, if the drive is supplying output voltage, or if the drive has tripped.

- **Led ON**: Yellow colour. When it is lit, indicates equipment is powered up. When it is blinking, indicates the drive gets any warning.
- **Led RUN**: Green colour. When it is lit, indicates the motor is powered by the SD700.
- **Led FAULT**: Red colour. When it is blinking, indicates the equipment is in fault status.

Figure 1.2 Status Visualization

1.1.2. Alphanumeric LCD Display

SD700 display has a LCD screen of four lines with sixteen characters each (16x4). Each line has different functions.

- **Status Line:** It is the top line.
It is always present and shows the SD700 status (STR – Start, STP – Stop, etc…).
It also shows the output current and the motor speed.
It is not configurable by the user.

- **Visualization Line 1:** It is the second line of the screen. It is always present and allows the selection of variables from the visualization menu.
It is configurable by the user.

- **Visualization Line 2:** It is the third line of the screen. It is always present and allows the selection of variables from the visualization menu.
It is configurable by the user.

- **Programming Line**: It is the fourth line.
It is used to display and / or set different parameters within the SD700.

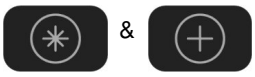
Figure 1.3 Detail of Display Lines

1.1.3. Control Keys

Function keys have multiple uses and can be operated individually or in combination with other keys:

It allows access to different parameters groups and sub-groups; it displays code explanations and allows adjustment of parameter values in combination with other keys. If a group has no sub-groups, it allows direct access to the parameters of the group.

To modify numeric parameters:

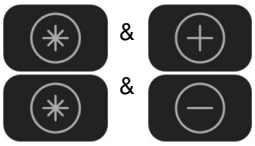


Simultaneously pushed, the value will increase.

Simultaneously pushed, the value will decrease.

To modify parameters of numbered options:

Pushing this key, the extended explanation will appear.



Simultaneously pushed will ascend the user through the varying options.
Simultaneously pushed will descend the user through the varying options.

It allows upward movement through the parameters groups and allows navigation for different parameters within a parameter group. It also allows the increase of parameters value.

It allows downward movement through the parameters groups and allows navigation for different parameters within a parameter group. It also allows the decrease of parameters value.

ENGLISH

When pushed for 2 seconds (approx.) it allows navigation between the programming line and visualisation lines available to the user. It also offers the possibility of escaping back to the previous sub-group or group.

To start the drive from the keypad when the control has been set as local control (check drive configuration).

To stop the drive from the keypad when the control has been set as local control. In the case of tripping this key can be used to reset the drive, if local control is enabled.

In the following figure you can see a programming example where you can observe the operation explained previously.

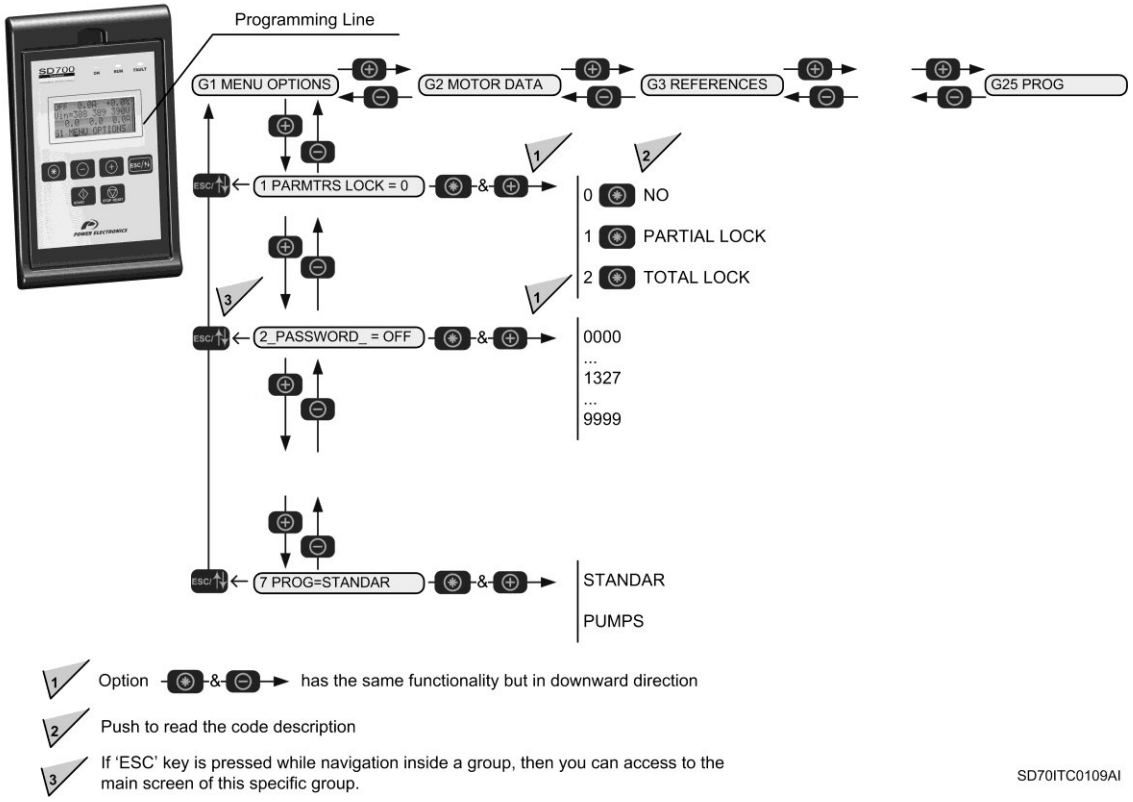


Figure 1.4 Example of parameters navigation

2. STATUS MESSAGES

The upper line of the display corresponds to the status line. In this line we can display the equipment status, motor current (A) and the motor speed (%). It is always displayed and it is not programmable by the user.

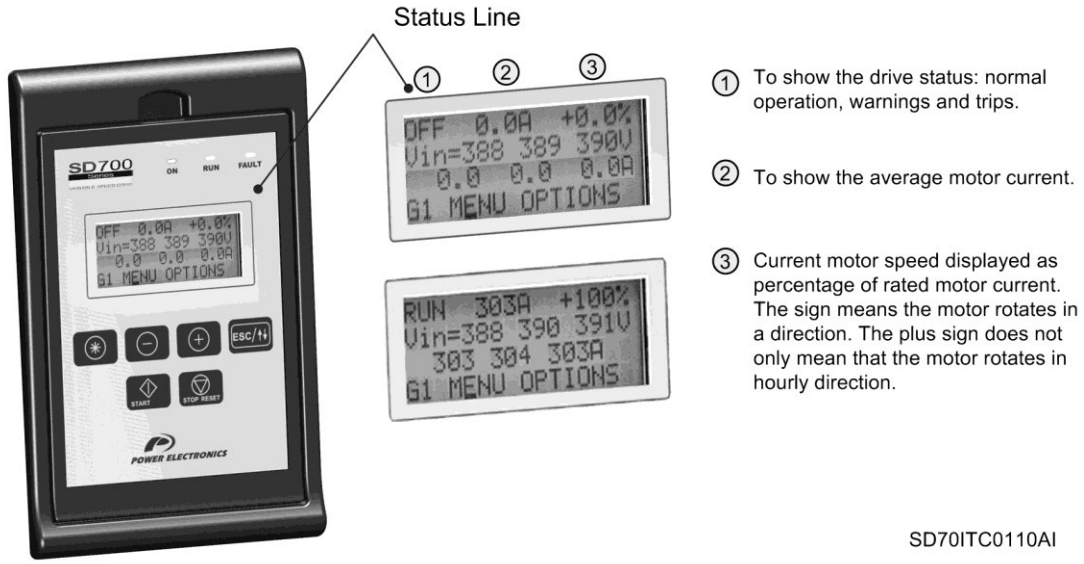

Figure 2.1 Status Line Description

Note: The user can access to the information displayed in status line via Modbus communication. See section 'Modbus Communication'.

2.1. List of Status Messages

Screen	Name	Description
OFF	Deactivated power	Drive power is deactivated.
ON	Activated power	Drive power is activated.
ACL	Accelerating	Drive is increasing the output frequency. Motor increasing in speed, it is accelerating.
RUN	Running	Drive is operating at reference speed. Operation at steady status.
DEC	Decelerating	Drive is decreasing the output frequency. Motor decreasing in speed, it is decelerating.
SPG	Stopping	Drive is decreasing the output frequency due to a stop command. Motor is stopping by ramp until zero speed is reached.
EST	Free run stop when a fault occurs	Drive is stopping by free run stop after a fault occurs (emergency stop). Motor stopping time is determined by inertia as the drive output has turned off.
SPN	Flying start	'Flying start' operation must be configured if required. The SD700 will search for the actual motor shaft speed once the drive has received a start command.
DCB	DC brake	SD700 is applying DC current injection to stop the motor.

Screen	Name	Description
TBR	DC brake ON delay	Drive is applying a delay time before DC current injection is active. When this time is elapsed, the DC brake will be active.
DLY	Start Delay Time	When a delay time has been set in order to start the equipment, after the start command has been activated, this message will be displayed until this time has elapsed.
IN1	Inch speed 1	SD700 is working according to inch speed 1 command and 'Start + Inch speed 1' mode is active. When operated in this mode the "Start + Inch speed 1" command is dominant over other inputs programmed for "Start" functionality. Therefore if one input is configured as 'Start' and it is deactivated; in spite of this deactivated input, the drive will start when 'Start + Inch speed 1' command is received. This is also valid for Inch speed 2 and 3.
IN2	Inch speed 2	SD700 is working according to inch speed 2 command. 'Start + Inch speed 2' mode is active.
IN3	Inch speed 3	SD700 is working according to inch speed 3 command. 'Start + Inch speed 3' mode is active.
HEA	Non condensing current is activated	SD700 is injecting DC current to prevent moisture condensing within the motor. ⚠ **CAUTION:** Although the motor is not running there is dangerous voltage. Run Led will be lit during this process. Be careful to avoid damages and personal injury.

2.2. List of Warning Messages

Screen	Name	Description
MOL	Motor overload	This message will appear when motor thermal model is increasing the estimated motor temperature.
MOC	Motor over-current	Motor current is higher than the rated current value.
DOC	Drive over-current	This message will appear if the output current is higher than 125% of the nominal current.
ILT	Current limitation	Current limit algorithm has been activated.
TLT	Torque limitation	Torque limit algorithm has been activated.
VLT	Voltage limitation	A high DC Link voltage level has been detected and the voltage limit control algorithm has been activated to protect the drive.
ACO	Asymmetric current	Asymmetry in output currents of the drive has been detected.
AVO	Output voltage imbalance	Asymmetry in output voltage of the drive has been detected.
AVI	Input voltage imbalance	Asymmetry in input voltage of the drive has been detected.
OVV	High input voltage	Input voltage of the equipment is reaching a dangerous level. The value is above the set value (protections settings).
UNV	Low input voltage	Input voltage of the equipment is reaching a dangerous level. The value is below the set value (protections settings).
S1L	Speed limit 1 reached	Motor speed has reached speed limit 1.
S2L	Speed limit 2 reached	Motor speed has reached speed limit 2.

3. VISUALISATION AND STATUS PARAMETERS. GROUP G0

These parameters constantly indicate the input signal status and dynamic parameter status of the SD700. Visualization lines are the second and the third lines. The user can select the parameter to be displayed in each line from the different visualization options.

To select a display parameter you should move to the cursor to the second or third line. For this, you need to press **ESC / ↑ ↓** key for approx two seconds. The cursor moves from one line to the next. Once located on the second or third line you can navigate like the programming line (line 4) and select the desired parameter to be displayed. Once selected these parameters are saved into memory. These parameters are then displayed on lines 2 and 3 whenever the drive is powered up.
Thanks to these lines user can display desired parameters and obtain additional information easily.

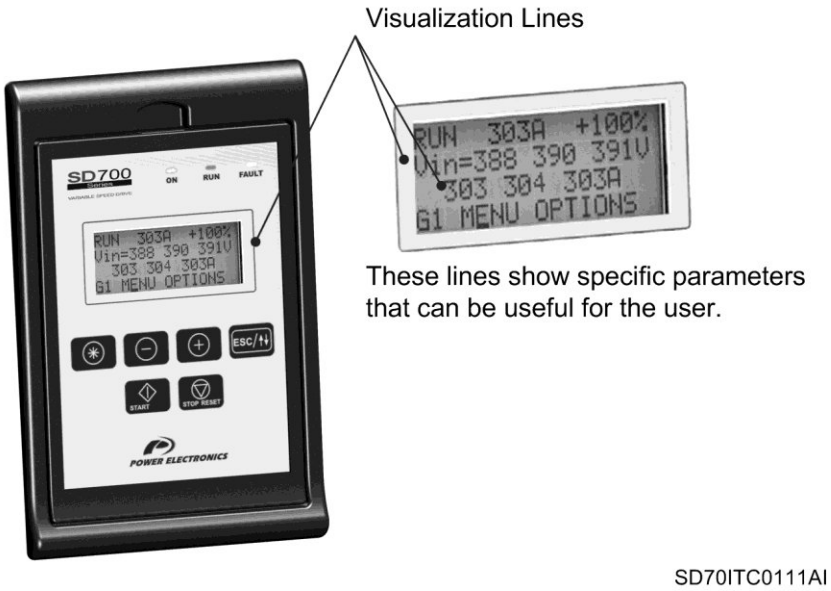

Figure 3.1 Visualization Lines Description

3.1. Parameters SV.1 – Motor Visualisation

Screen	Units	Description
Sp Ref = +000%	% motor speed	It shows the present reference value of speed which is applied to the motor.
Tq Ref = 0.0%	%motor torque	It shows the present reference value of torque which is applied to the motor.
Mtr Speed = +0rpm	rpm	It shows the motor speed in revs per minute.
Mtr Sp = +0.0%	%	It shows the motor speed in %. It corresponds with the third field of the status line ➔ **OFF 0.0A +0.0%**
Mtr Freq = +0.0Hz	Hz	It shows the frequency being applied to the motor.
Mtr Vout = 0V	V	It shows the present voltage applied to the motor.
Mtr Iout = 0.0A	A	It shows the present current flowing to the motor. It corresponds with the second field of the status line ➔ **OFF 0.0A +0.0%**
Mtr Torqe = 0.0%	% motor torque	It shows the present torque applied to the motor.
Mtr Pfactr = 0.0	-	It shows the power factor of the motor.
Mtr Pwr = +0.0kW	kW	It shows the instantaneous power consumption of the motor.
0.0A 0.0A 0.0A	A	It shows the instantaneous current of each phase of the motor (U, V and W).
Vmt= 0 0 0V	V	It shows the instantaneous voltage applied to the motor terminals.
PTC Motor = 0	-	It shows if the motor PTC (temperature sensor) is connected. X: PTC Connected. 0: PTC Not Connected.
Motor Temp = 0.0%	% Motor heat	It shows the estimated motor temperature. A level of 110% will cause F25 trip (motor overload).
Enco. Pulso =0	pulses	It shows the encoder pulses.
Clsped = 0 rpm	rpm	Real speed measured by the encoder.

3.2. Parameters SV.2 – Drive Visualisation

Screen	Units	Description
390 390 390V	V	It shows the input instantaneous voltage applied to the drive (RS, ST, RT).
Inp Vol = 390V	V	It shows the average input voltage to the drive.
50.0 50.0 50.0Hz	Hz	It shows the frequency of the input voltage to the drive.
Bus vol = 540V	VDC	It shows DC Link voltage of the drive.
IGBT Temp =+23ºC	ºC	It shows the temperature measured at the power stage of the drive output.
Drive T. =+26ºC	ºC	It shows the temperature measured inside the electronics chamber of the drive.

3.3. Parameters SV.3 – Visualisation

<table>
<tr><th>Screen</th><th>Units</th><th>Description</th></tr>
<tr><td>ANLG IN1 = +0.0V</td><td>V or mA</td><td>It shows the value of Analogue Input 1.</td></tr>
<tr><td>AIN1 Refr = +0.00%</td><td>% bottom scale AI1</td><td>It shows the value or the PID reference proportional to Analogue Input 1 in percentage.</td></tr>
<tr><td>AIN1 S = +0.00l/s</td><td>Engineering units</td><td>It shows the value of sensor 1 associated to the Analogue Input 1.</td></tr>
<tr><td>ANLG IN2 = +0.0V</td><td>V or mA</td><td>It shows the value of the Analogue Input 2.</td></tr>
<tr><td>AIN2 Refr = +0.00%</td><td>% bottom scale AI2</td><td>It shows the value or the PID reference proportional to the Analogue Input 2 signal.</td></tr>
<tr><td>AIN 2 S = +0.00Bar</td><td>Engineering units</td><td>It shows the value of sensor 2 associated to the Analogue Input 2.</td></tr>

</table>
Note: They both are settable during run.</td></tr>
<tr><td>Modbus Traffic:O</td><td>0 / X</td><td>“X” will be displayed if Modbus communication exists through RS232 or RS485 user port.
Furthermore, “X” will blink at constant frequency while communication is active.
After half second is elapsed without communication, “O” will be displayed.</td></tr>
<tr><td>Display_traffi = 0</td><td>-</td><td>It shows if the display is connected.
<table>
<tr><th>Screen</th><th>Description</th></tr>
<tr><td>0</td><td>The display is not connected.</td></tr>
<tr><td>1</td><td>The display is connected.</td></tr>
</table></td></tr>
</table>

3.4. Parameters SV.4 – Internal Visualisation

Screen	Units	Description
Actual Fault = 00	-	It shows the present code fault. See fault history G13.
Drive Curr = 170A	A	It shows the drive rated current (maximum current of the equipment at 50ºC).
Drive Volt = 400V	V	It shows the drive rated voltage.
S/W	-	It shows the software version installed into the equipment.
H/W y.y	-	It shows the hardware version of the equipment.
PID R% = +0.0%	% feedback range	It shows the reference value in PID mode of the equipment standard program.
PID F% = +0.0%	% AI used as feedback	It shows the feedback value in PID mode of the equipment standard program.
PID Error = +0.0%	% feedback range	It shows the error value in PID mode that means, the difference between the reference value and the real value of the system feedback signal.
Comparators: 000	-	It shows if comparators are activated or not. X: Active / 0: Not Active.
FLT.STAT.=NO FLT	NO FLT ---	It shows if the equipment is in faulty status. If the equipment is in faulty status, it shows the status of the drive before the fault is produced; when there is not fault, it shows 'NO FLT'.
Fault Diag.=N	N Y	When it is set to 'Y' (YES), the parameters of groups 'SV.1 Motor Visualization' and 'SV.2 Drive Visualization' are hold with the last values at the moment of the last fault is produced. If the user sets the parameter to 'N' (NO), or after 135 seconds are elapsed, the parameters will show the actual values again. The hold values are saved in memory until next fault will be produced, even if the input power of the drive is lost.

3.5. Parameters SV.5 – Programmable Parameters

This group is not only a display group. Some parameters such as speed, pressure and inch speeds can be adjusted in this group. These parameters are also available in their corresponding parameter groups. This is a simple way to allow user adjustment of basic parameters without entering the main programming groups.

Screen	Units	Description
Local Sp = +100%	% motor speed	It shows the speed reference value in local mode (introduced by keypad). See G3.3 parameter for additional data.
PID Local = +100%	% feedback	It allows user to select the PID reference in local mode. See G6.2 parameter for additional data.
Mref 1 = +10.0%	% motor speed	It allows user to set the speed value assigned to Multi-reference 1. See G14.1 parameter for additional data.
Mref 2 = +20.0%	% motor speed	It allows user to set the speed value assigned to Multi-reference 2. See G14.2 parameter for additional data.
Mref 3 = +30.0%	% motor speed	It allows user to set the speed value assigned to Multi-reference 3. See G14.3 parameter for additional data.
Mref 4 = +40.0%	% motor speed	It allows user to set the speed value assigned to Multi-reference 4. See G14.4 parameter for additional data.
Mref 5 = +50.0%	% motor speed	It allows user to set the speed value assigned to Multi-reference 5. See G14.5 parameter for additional data.
Mref 6 = +60.0%	% motor speed	It allows user to set the speed value assigned to Multi-reference 6. See G14.6 parameter for additional data.
Mref 7 = +70.0%	% motor speed	It allows user to set the speed value assigned to Multi-reference 7. See G14.7 parameter for additional data.
Inch Spd1 = 0.00%	% motor speed	It allows user to set the step frequency 1 value. See G15.1 for additional data.
Inch Spd2 = 0.00%	% motor speed	It allows user to set the step frequency 2 value. See G15.2 for additional data.
Inch Spd3 = 0.00%	% motor speed	It allows user to set the step frequency 3 value. See G15.1 and 2 for additional data.

3.6. Parameters SV.6 – Registers

This group includes several registers of general information about the drive use. Therefore, we can visualize a total and partial counter for running time (RUN).

Screen	Units	Description
TOT= d h	Days and Hours	It shows the total time during which the drive is running (RUN).
PAR= d h	Days and Hours	It shows the partial time during which the drive is running (RUN).
CLEAR PARTIAL=N	-	It allows resetting the counter of partial time for running status (RUN).
TOTAL ENERGY	kW to GW	Shows the drive total energy consumption.
PARTIAL ENERGY	kW to GW	Shows the drive partial energy consumption.
RSET PRTL ENRG=N	-	The user is able to reset the partial energy counter.

4. DESCRIPTION OF PROGRAMMING PARAMETERS

The different parameters of the SD700 are displayed in the alphanumeric LCD. These parameters are organized in groups (G1, G2, G3, …). To access to the parameters or sub-groups which are in a lower level, press the [*] key. When you have accessed the desired parameter, this parameter will be shown as either a numerical value or a list of possible options.

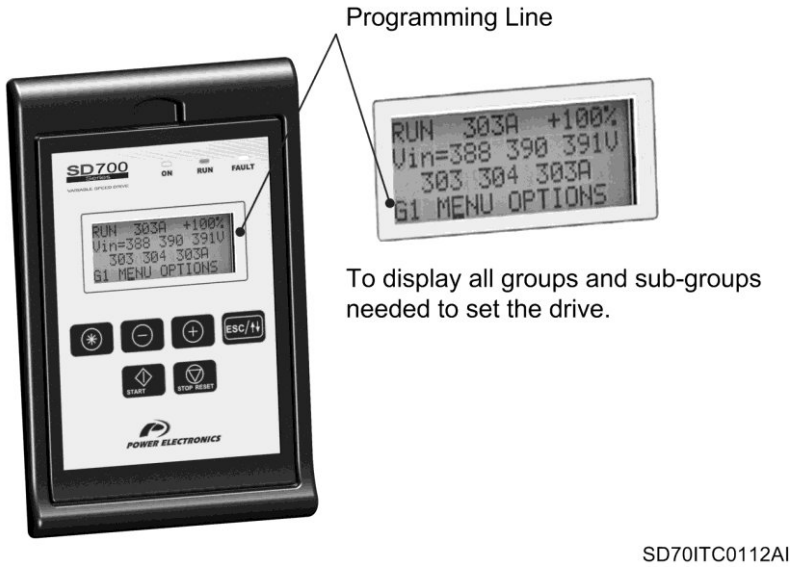

Figure 4.1 Detail of Programming Line.

See the information below for the whole parameter list and possible options of configuration.

4.1. Group 1 – G1: Options Menu

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 LOCK PARMTRS=0	**G1.1** / Parameter lock	0 – 2	It allows user to lock SD700 parameters totally or partially. To lock you have to introduce a password in G1.2. **OPT** / **DESCRIPTION** / **FUNCTION** 0 / NO / Parameter lock is not active. 1 / PARTIAL LOCK / All of parameters are locked except for G1.1, G1.2, G3.3 and G6.2 (PID reference). 2 / TOTAL LOCK / Only G1.1 and G1.2 can be modified.	YES
2 PASSWORD=OFF	**G1.2** / Access password	OFF, 0000 – 9999	It allows user to introduce a password to lock parameters and avoid unauthorized changes in the programming. If in G1.1 'Parameter lock ', option '1 or 2' has been chosen, then this parameter appears automatically. Unlock: In G1.1 = 1 or 2 set to '0 ➔ NO'. **2 PASSWORD_?OFF** will be displayed.	YES
3 PSW ERR=XXXX	**G1.2b** / Unlock password recovery	0000 – 9999	To recover the password the following formula can be used: Unlock password = (XXXX/2)-3.	YES
4 LANGUA=ESPANOL	**G1.4** / Language selection	ENGLISH ESPANOL DEUTSCH PORTUGE	It allows selection of the user language.	NO

<table>
<tr><th>Parameter / Default Value</th><th>Name / Description</th><th>Range</th><th>Function</th><th>Set on RUN</th></tr>

4.1.1. Subgroup 1.10 – S1.10: Eloader (EEPROM Charger)

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
UPLOAD=N	**G1.10.1** / Saves the parameters of the drive to the display.	N Y	When adjusting this value to Yes, the copy of parameters to the display starts, saving the configuration of the drive. A screen will appear showing the uploading progress: **UPLOADING…100%** When this process is over, the progress screen will automatically return to the main screen, set by default to No. **Note:** In order to carry out the parameter load correctly, the user should firstly configure the digital inputs concerning 'STOP' functions before any other function.	YES
DOWNLOAD=N	**G1.10.2** / Saves the parameters of the display to the drive.	N Y	When adjusting this value to Yes, the copy of parameters stored in the display to the drive will start modifying and programming the parameters of this new drive. A screen will appear showing the downloading progress: **DOWNLOADING …100%** When this process is over, the progress screen will automatically change to the main screen, set by default to No. **Note:** When using the Pump Applications. Before downloading parameters from the display, the parameter [G1.7] must be set as 'PUMP'.	NO

4.2. Group 2 – G2: Motor Nameplate Data

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 MTR CUR=(*) **MOTOR CURRENT**	**G2.1** / Motor rated current	1 – 9999A	It allows setting of the motor rated current according to its nameplate.	NO
2 MTR VOLT=400V **MOTOR VOLTAGE**	**G2.2** / Motor rated voltage	220 – 999V	It allows setting of the motor rated voltage according to its nameplate.	NO
3 MTR PWR=(*) **MOTOR POWER**	**G2.3** / Motor rated power	0 – 6500Kw	It allows setting of the motor rated power according to its nameplate.	NO
4 MTR RPM=1485 **MOTOR SPEED(rpm)**	**G2.4** / Motor rpm	0 – 24000rpm	It allows setting of the motor rated speed according to its nameplate.	NO
5 MTR PFA=0.85 **MTR POWER FACTOR**	**G2.5** / Cosine Phi	0 to 0.99	It allows setting of motor cosine Phi according its nameplate.	NO
6 MTR FRQ=50Hz **MOTOR FREQUENCY**	**G2.6** / Motor rated frequency	0 – 100Hz	It allows setting of the motor rated frequency according to its nameplate.	NO
7 MTR COOLN=63% **MOTOR COOLING**	**G2.7** / Motor cooling at zero speed	OFF, 5% – 100%	It provides adjustment of sensitive of the motor thermal model based on actual motor cooling. The following settings can be taken as reference: Submersible pumps and non-deflagrating motor ➔ 5% Self-cool motor ➔ 63% Forced-cool motor ➔ 100% **Note:** If the drive is working at low speeds for a long time and several trips caused by motor thermal model are produced even though the motor was not hot then this value can be increased slightly to avoid further tripping. **Note:** If it is set to 'OFF', thermal model will be deactivated. **Note:** This protection estimates the temperature in the motor. To guarantee the motor protection, it is recommended to use the motor sensor (PTC).	NO

∗ This value depends on the drive rated current.

Note: If all of these values are not entered correctly, the SD700 will not operate correctly. When the motor nameplate offers multiple configuration possibilities, as in case of the start-delta motor connection, ensure the correct data is entered for the appropriate configuration.

4.3. Group 3 – G3: References

<table>

<table>
<tr><th>OPT</th><th>DESCRIPTION</th><th>FUNCTION</th></tr>
<tr><td>4</td><td>MOTORIZED POT</td><td>It assigns the up and down reference function for two of the digital inputs.
DI5 = Up (NO contact)
DI6 = Down (NC contact)
Reference limits will be the speed limits set in ‘G10 LIMITS’.
Programming a change ramp is possible at:
G5.7 PMT ACL1=3%/s
G5.8 PMT DCL1=3%/s
G5.9 PMT ACL2=1%/s
G5.10 PMT DCL2=1%/s
G5.11 PMOT BRK=OFF
Note: In this mode, the reference set by potentiometer will be memorized even if the motor is stopped and also in the case of a power loss.</td></tr>
<tr><td>5</td><td>ERASAB POT</td><td>It operates in the same way as option 4, but when the motor is stopped or a power loss occurs, the reference will not be memorized. In this case the minimum reference value set in G10.1 or G10.3 will be the default speed. This will happen when the limit is above zero, if the limit is equal or below zero, the default speed will be zero.</td></tr>
</table>
⚠ Caution: Digital input configuration changes their settings automatically. Make sure there is not a hazard due to accidental motor starting that can cause property damage or personal injury.</td><td>NO</td></tr>
</table>

Pumps program activation, in G1.7 PROG = PUMP, requires the following considerations:

There are some configuration options available when the pump program is active, which can be set in the same way that the options available in the standard program.
Nevertheless, when the pump program is active, the drive will assume that only the configurable options from 50 to 75 (for G4.1.5 to G4.1.10) can be set, without taking into consideration the setting on parameter ‘G4.1.4 DIGIT I MODE’, which means a block setting.

All that means that the user will configure the pump program freely, according to his requirements, selecting the correct functionality and protections. For a correct programming of the digital inputs when the pump program is active, there is additional information in ‘Pump Application Manual’, where information about Pump Control (G25) is included.

Note: Selection of the pump program will set all the Digital Inputs to mode ’00 – un used’. If re-programming is needed, it will be necessary to configure their functionality in a separate way again. So it guarantees a safety installation operation, avoiding that hardware external to the equipment can cause any kind of damage.

Note: The digital outputs will also be affected due to pump control activation.

To select one auxiliary pump it is necessary to act in the following way:

- Set any free digital input to options ’52 FIX PUMP1 FLT’, ’53 FIX PUMP2 FLT’, ’54 FIX PUMP3 FLT’, ’55 FIX PUMP4 FLT’ or ’56 FIX PUMP5 FLT’
- To enable the control of the pump in the corresponding screen G25.9.1, G25.9.2, G25.9.3, G25.9.4 and G25.9.5 respectively.

To remove this pump configuration and release the relay for another use, the user should:

- Disable the control of the pump in the corresponding screen G25.9.1, G25.9.2, G25.9.3, G25.9.4 or G25.9.5 respectively.

<table>
<tr><th>Parameter / Default Value</th><th>Name / Description</th><th>Range</th><th>Function</th><th>Set on RUN</th></tr>
<tr><td>5 DIGITL IN 1=06</td><td>G4.1.5 / Multi-function Digital Input 1 configuration</td><td>00 – 75</td><td rowspan="5">It allows user to configure the digital inputs for individual use.

'G4.2.7 Sma1=+10.0l/s' ➔ Maximum range of sensor.</td><td>YES</td></tr>
</table>

[3] Available only when 'G4.2.1 SENSOR 1 = Y'.

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
3 AIN1 FORMAT=V	**G4.2.3** / Analogue Input 1 format	V mA	It allows configuration of the analogue input 1 format for either a voltage or current signal. Set according to the sensor that will be used.	YES
4 INmin1=+0V **AIN1 LOW RANGE**	**G4.2.4** / Minimum range of Analogue Input 1	-10V to G4.2.6 +0mA to G4.2.6	It determines the minimum voltage or current value for analogue input 1. Set according to the characteristics of the sensor that will be connected.	YES
5 Smi1=+0.0l/s[3] **SENS1 LOW RANGE**	**G4.2.5** / Minimum range of sensor 1	-3200 to G4.2.7 Engineering units	It sets the minimum units value of the sensor connected to analogue input 1. This value should also correspond to the minimum voltage or current level of the sensor set in 'G4.2.4 INmin1'. **Note:** This value should be checked if the units are changed in 'G4.2.2 SENSOR 1'. It will be set to operate in open loop and close loop.	YES
6 INmax1=+10V **AIN1 HIGH RANGE**	**G4.2.6** / Maximum range of Analogue Input 1	G4.2.4 to +10V G4.2.4 to +20mA	It determines the maximum voltage or current value for analogue input 1. Set according to the characteristics of the sensor that will be connected.	YES
7 Sma1=+10.0l/s[3] **SENS1 HIGH RANGE**	**G4.2.7** / Maximum range of sensor 1	G4.2.5 to +3200 Engineering units	It sets the maximum units value of the sensor connected to analogue input 1. This value should also correspond to the maximum voltage or current level of the sensor set in 'G4.2.6 INmax1'. **Note:** This value should be checked if the units are changed in 'G4.2.2 SENSOR 1'. For this, it is necessary to set this value in open loop and close loop configurations.	YES
8 SPD LO1=+0% **SPD LO RNG AIN1**	**G4.2.8** / Speed for the minimum range of Analogue Input 1	-250% to G4.2.9	It allows scaling of the speed reference to correspond with the minimum range of the analogue input 1 as set in 'G4.2.4 INmin1'. The value is a percentage of the motor rated speed.	YES
9 SPD HI1=+100% **SPD HIG RNG AIN1**	**G4.2.9** / Speed for the maximum range Analogue Input 1	G4.2.8 to +250%	It allows scaling of the speed reference to correspond with the maximum range of the analogue input 1 as set in 'G4.2.6 INmax1'. The value is a percentage of the motor rated speed.	YES
10 FB1 = + 0.0l/s [3]	**G4.2.10 /** Minimum operating range of sensor	-3200 to G4.2.12 Engineering units	To set the minimum operating range, if the real operating range is different than the range of the sensor which will be used as sensor in open loop. It corresponds with the voltage or current level set in 'G4.2.4INmin1'. This parameter should be configured to operate with sensor in open loop.	YES
11 FB1 – Sp = 0% [3]	**G4.2.11 /** Minimum speed range for sensor in open loop	-250% to +250%	It allows setting the minimum speed range corresponding to the minimum sensor range set in 'G4.2.10 FB1', when the sensor will be used in open loop. The value is a percentage of the motor rated speed.	YES
12 FA1 = +10.0l/s [3]	**G4.2.12 /** Maximum operating range of sensor	G4.2.10 to +3200 Engineering units	To set the maximum operating range, if the real operating range is different than the range of the sensor which will be used as sensor in open loop. It corresponds with the voltage or current level set in 'G4.2.6INmin1'. This parameter should be configured to operate with sensor in open loop.	YES
13 FA1 – SP = 100%[3]	**G4.2.13 /** Maximum speed range for sensor in open loop	-250% to +250%	It allows setting the maximum speed range corresponding to the maximum sensor range set in 'G4.2.12 FA1', when the sensor will be used in open loop. The value is a percentage of the motor rated speed.	YES
14 AIN1 LOSS=N	**G4.2.14** / Protection for Analogue Input 1 loss	N Y	To set the drive stop mode when a loss of the analogue input 1 signal occurs. **OPTION** / **FUNCTION** N=NO: Function disabled. Y=YES: When the analogue input level decreases down to zero value, sensor will be considered damaged and the drive will stop generating a fault 'F42 AIN1 LOSS'.	YES
15 1_Z BAND=OFF **AIN1 ZERO BAND**	**G4.2.15** / Zero band filter for Analogue Input 1	OFF = 0.0, 0.1 to 2.0%	Filtering of analogue input 1 signal. Setting this value we can filter analogue input 1 to avoid possible electrical noise preventing the analogue reading a zero value.	YES
16 FILTER1=OFF **AIN1 STABIL FILT**	**G4.2.16** / Low Pass filter for Analogue Input 1	OFF = 0.0, 0.1 to 20.0%	It allows filtering the Analogue Input 1 signal. Setting the value of this time constant we can eliminate possible instabilities in the value of the same ones due to noise, wiring faults, etc. **Note:** When applying a Low Pass filter to any analogue signal, a delay time in the own signal is generated. This delay time is the value of the configured time constant approximately.	YES

[3] Available only when 'G4.2.1 SENSOR 1 = Y'.

ENGLISH

4.4.3. Subgroup 4.3 – S4.3: Analogue Input 2

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 SENSOR 2 ?=N	**G4.3.1** / Sensor of Analogue Input 2 enable	N Y	It allows user to configure analogue input 2 for use with a sensor and activates the parameters which are necessary to set it up. See G4.3.2 up to G4.3.7. **OPTION** / **FUNCTION** N=NO – The analogue input will remained scaled in defaults units (%). Y=YES – The analogue input and any variables relating to the analogue input will be configured in the engineering units selected in G4.3.2.	YES
2 SENSOR 2=Bar[4]	**G4.3.2** / Selection of sensor 2 units	% l/s m³/s l/m m³/m l/h m³/h m/s m/m m/h Bar kPa Psi m ºC ºF ºK Hz rpm	It allows selection of different units of measurement for the analogue input 2 according to the sensor that is used. If this parameter is modified, the minimum and maximum values of the sensor range must be adjusted to ensure correct configuration. Therefore, the following set values should be checked: 'G4.3.5 Smi2=+0.0Bar' ➔ Minimum range of sensor. 'G4.3.7 Sma2=+10.0Bar' ➔ Maximum range of sensor.	YES
3 AIN2 FORMAT=mA	**G4.3.3** / Analogue Input 2 format	V mA	It allows configuration of the analogue input 2 format for either a voltage or current signal. Set according to the sensor that will be used.	YES
4 INmin2=+4mA **AIN2 LOW RANGE**	**G4.3.4** / Minimum range of Analogue Input 2	-10V to G4.3.6 +0mA to G4.3.6	It determines the minimum voltage or current value for analogue input 2. Set according to the characteristics of the sensor that will be connected.	YES
5 Smi2=+0.0Bar[4] **SENS2 LOW RANGE**	**G4.3.5** / Minimum range of sensor 2	-3200 to G4.3.7 Engineering units	It sets the minimum units value of the sensor connected to the analogue input 2. This value should also correspond to the minimum voltage or current level of the sensor set in 'G4.3.4 INmin2'. **Note:** This value should be checked if the units are changed in 'G4.3.2 SENSOR 2'. It will be set to operate in open loop and close loop.	YES
6 INmax2=+20mA **AIN2 HIGH RANGE**	**G4.3.6** / Maximum range of Analogue Input 2	G4.3.4 to +10V G4.3.4 to +20mA	It determines the maximum voltage or current value for the analogue input 2. Set according to the characteristics of the sensor that will be connected.	YES
7 Sma2=+10.0Bar[4] **SENS2 HIGH RANGE**	**G4.3.7** / Maximum range of sensor 2	G4.3.5 to +3200 Engineering units	It sets the maximum units value of the sensor connected to the analogue input 2. This value should also correspond to the maximum voltage or current level of the sensor set in 'G4.3.6 INmax2'. **Note:** This value should be checked if the units are changed in 'G4.3.2 SENSOR 2'. It is necessary to set this value in open loop and close loop configurations.	YES
8 SPD LO2=+0% **SPD LO RNG AIN2**	**G4.3.8** / Speed for the minimum range of Analogue Input 2	-250% to G4.3.9	It allows scaling of the speed reference to correspond with the minimum range of the analogue input 2 as set in 'G4.3.4 INmin2'. It is configured to set the speed reference via analogue input. Set the parameter 'G4.3.1 SENSOR 2 ?= N'. The value is a percentage of the motor rated speed.	YES
9 SPD HI2=+100% **SPD HIG RNG AIN2**	**G4.3.9** / Speed for the maximum range of Analogue Input 2	G4.3.8 to +250%	It allows scaling of the speed reference to correspond with the maximum range of the analogue input 2 as set in 'G4.3.6 INmax2'. It is configured to set the speed reference via analogue input. Set the parameter 'G4.3.1 SENSOR 2 ?= N'. The value is a percentage of the motor rated speed.	YES
10 FB2 = + 0.0Bar [4]	**G4.3.10 /** Minimum operating range of sensor	-3200 to G4.3.12 Engineering units	To set the minimum operating range, if the real operating range is different than the range of the sensor which will be used as sensor in open loop. It corresponds with the voltage or current level set in 'G4.3.4INmin2'. This parameter should be configured to operate with sensor in open loop.	YES
11 FB2 – Sp = 0% [4]	**G4.3.11 /** Minimum speed range for sensor in open loop	-250% to +250%	It allows setting the minimum speed range corresponding to the minimum sensor range set in 'G4.3.10 FB2', when the sensor will be used in open loop. The value is a percentage of the motor rated speed.	YES

[4] It will be available in case of 'G4.3.1 SENSOR 2 = Y'.

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
12 FA2 = +10.0Bar [4]	**G4.3.12 /** Maximum operating range of sensor	G4.3.10 to +3200 Engineering units	To set the maximum operating range, if the real operating range is different than the range of the sensor which will be used as sensor in open loop. It corresponds with the voltage or current level set in 'G4.3.6INmin2'. This parameter should be configured to operate with sensor in open loop.	YES
13 FA2 – SP = 100%[4]	**G4.3.13 /** Maximum speed range for sensor in open loop	-250% to +250%	It allows setting the maximum speed range corresponding to the maximum sensor range set in 'G4.3.12 FA2', when the sensor will be used in open loop. The value is a percentage of the motor rated speed.	
14 AIN2 LOSS=N	**G4.3.14** / Protection for Analogue Input 2 loss	N Y	To set the drive stop mode when a loss of the analogue input 2 signal occurs. **OPTION** / **FUNCTION** N=NO – Function disabled. Y=YES – When the analogue input level decreases down to zero value, sensor will be considered damaged and the drive will stop generating a fault 'F43 AIN2 LOSS'.	YES
15 2_Z BAND=OFF AIN2 ZERO BAND	**G4.3.15** / Zero band filter for Analogue Input 2	OFF=0.0, 0.1 to 2.0%	Filtering of analogue input 2 signal. Setting this value we can filter analogue input 2 to avoid possible electrical noise preventing the analogue reading a zero value.	YES
16 FILTER2=OFF AIN2 STABIL FILT	**G4.3.16** / Low Pass filter for Analogue Input 2	OFF = 0.0, 0.1 to 20.0%	It allows filtering the Analogue Input 2 signal. Setting the value of this time constant we can eliminate possible instabilities in the value of the same ones due to noise, wiring faults, etc. **Note:** When applying a Low Pass filter to any analogue signal, a delay time in the own signal is generated. This delay time is the value of the configured time constant approximately.	YES

[4] It will be available in case of 'G4.3.1 SENSOR 2 = Y'.

4.4.4. Subgroup 4.4 – S4.4: Pulse Input

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 Sensr U=l/s	**G4.4.1** / Sensor units of Pulse Input	% l/s m³/s l/m m³/m l/h m³/h m/s m/m m/h	Allows selection of the units to measure the flow. **Note:** To use this input you should have a flowmeter with a digital pulse output of pulse width greater than 50ms. Used for flow limitation algorithm. See S25.10.	YES
2 Pls/s = 100l/s LIQU AMOUNT/PULS	**G4.4.2** / Flowmeter configuration	0 to 32760 Flow units	It allows setting the amount of the fluid per pulse received. For example, if setting is '2Pls/s=100l/s', and the present flow is 500l/s, 5 pulses/sec will be received.	YES
3 M Rn=1000l/s FLOW MAX RANGE	**G4.4.3** / Maximum range of flow meter	0 to 32760 Flow units	It allows user to set the maximum range of the flow meter. It is used to calculate the reset level of the flow control algorithm. Parameter G25.10.4 is linked with the value set in this parameter. Example: If you set a maximum range of 100 units 'G4.4.3=100', and the reset level of the flow algorithm is desired below 30 units, you have to set 'G25.10.4=30%'. For additional information, see the 'Pump Application Manual' for the SD700.	YES

4.4.5. Subgroup 4.6 – S4.6: Optic Fiber

4.4.5.1. Subgroup S4.6.1 – 1. MODO FIBRA

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 FIBER MODE = 0	**G4.6.1** / Fiber Mode	0-2	This parameter is used to select the drive role in the optical fiber network. We can select three options: **OPT** / **FUNCTION** / **DESCRIPTION** 0 – MAS – The equipment will make the functions of master in the network 1 – SLV – The equipment will act as a slave, taking orders of the master and transmitting its status 2 – NON – The equipment will be independent in the network, it hasn't slave or master function.	NO

4.4.5.2. Subgroup S4.6.3 – Input O.F

<table>
<tr><th>Parameter / Default Value</th><th>Name / Description</th><th>Range</th><th>Function</th><th>Set on RUN</th></tr>
<tr><td>5 CONTROL = 0</td><td>G4.6.3.5 / Control</td><td>0-2</td><td>This parameter receives both the Start order and the Run status coming from the master. This status will be sent to the subgroups G4.1.1 and G4.1.2, allowing the slave to start with Start order or the Run status of the master.
<table>
<tr><th>OPT</th><th>FUNCTION</th><th>DESCRIPTION</th></tr>
<tr><td>0</td><td>NONE</td><td>The equipment will not take into account the START order or the RUN status. If we select FIBER in G4.1.1 or G4.1.2, the variable speed drive will not start.</td></tr>
<tr><td>1</td><td>START</td><td>The Start order of the master will be sent to the FIBER option in the groups G4.1.1 and G4.1.2. It means that if we select the fiber option in the control mode while the master has a Start order, the slave will start.</td></tr>
<tr><td>2</td><td>RUN</td><td>The RUN status of the master will be sent to the FIBER option in G4.1.1 and G4.1.2. When the fiber option is selected in a control mode and the master is in RUN, the slave will start and won't stop till the RUN has been disappeared of the master.</td></tr>
</table></td><td>NO</td></tr>
<tr><td>6 FAULT = 0</td><td>G4.6.3.6 / Control (Master)</td><td>0-1</td><td>When this option is selected in the master drive and the system is working in closed ring mode, the master will STOP and show “F76 SLAVE O.F”, if one or more slaves are faulted. Otherwise, the master will continue running.
<table>
<tr><th>OPT</th><th>FUNCTION</th></tr>
<tr><td>0</td><td>No</td></tr>
<tr><td>1</td><td>Yes</td></tr>
</table></td><td>YES</td></tr>
<tr><td>7 SPIN STP = 0</td><td>G4.6.3.7 / SPIN STOP (Slave)</td><td>0-1</td><td>If we select this option, when the master will fault for any reason, all the slaves will stop automatically through a spin stop.
<table>
<tr><th>OPT</th><th>FUNCTION</th></tr>
<tr><td>0</td><td>No</td></tr>
<tr><td>1</td><td>Yes</td></tr>
</table></td><td>NO</td></tr>
</table>

4.4.5.3. Subgroup S4.6.5 – T/O F.O

<table>
<tr><th>Parameter / Default Value</th><th>Name / Description</th><th>Range</th><th>Function</th><th>Set on RUN</th></tr>
<tr><td>5 T/O F.O = 0</td><td>G4.6.5/ Time out optical fiber (Slave)</td><td>OFF, 0.10 9.99</td><td>Permits Open loop and close loop mode selection. Additionally for close loop mode, enable to establish the timeout response for slave. If the master does not receive response within the time selected the slave sets “F77 OPT FIB TO” fault.
<table>
<tr><td>OPT</td><td>FUNCTION</td></tr>
<tr><td>OFF</td><td>Close loop disable</td></tr>
<tr><td>0.100s</td><td>Close loop enable 0.1s</td></tr>
<tr><td>....</td><td></td></tr>
<tr><td>9.990s</td><td>Slave timeout response</td></tr>
</table>
Otherwise, and also in the open loop, the option of “listener” slave is available. The slave only pays attention on the bus communications and does not make any action. This mode has been created to work with CANOpen and Devicenet boards</td><td>NO</td></tr>
</table>

4.5. Group 5 – G5: Acceleration and Deceleration Ramps

<table>
<tr><th>Parameter / Default Value</th><th>Name / Description</th><th>Range</th><th>Function</th><th>Set on RUN</th></tr>
<tr><td>1 ACC1=5.0%/s
INITIAL ACCEL</td><td>G5.1 / Acceleration ramp 1</td><td>0.01 – 650% / sec</td><td>Allows user to set acceleration ramp 1. The setting is in acceleration units (increase in percentage of speed per second). For example, a 10%/s ramp means that the drive increases its speed by 10% of motor rated speed for each second. This ramp will be set according to the requirements of each process.</td><td>YES</td></tr>
<tr><td>2 DECEL1=1.0%/s
INITIAL DECEL</td><td>G5.2 / Deceleration ramp 1</td><td>0.01 – 650% / sec</td><td>Allows user to set deceleration ramp 1. The setting is in deceleration units (decrease in percentage of speed per second). For example, a 10%/s ramp means that the drive decreases its speed by 10% of motor rated speed for each second. This ramp will be set according to the requirements of each process.
Note: For drives which input voltage is 400V, the default values will be:
- From 6A to 48A =10%/sec
- From 60A to 170A =5%/sec
- From 210A to Imax =2%/sec</td><td>YES</td></tr>
</table>

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
3 ACC2=10.0%/s SECOND ACCELE	**G5.3** / Acceleration ramp 2	0.01 – 650% / sec	Allows user to set the alternative acceleration ramp. The setting is based in acceleration units (increase in percentage of speed per second), like the main ramp setting. The drive will apply acceleration ramp 1 until motor speed exceeds the value set in 'G5.5 BRK ACC'. From here on it will apply the alternative ramp value. If 'G5.5 BRK ACC = OFF' no ramp change will occur.	YES
4 DECEL2=10.0%/s SECOND DECELE	**G5.4** / Deceleration ramp 2	0.01 – 650% / sec	Allows user to set the alternative deceleration ramp. The setting is in deceleration units (decrease in percentage of speed per second), like the main ramp setting. The drive will apply deceleration ramp 2 until motor speed is below the value set in 'G5.6 BRK DEC'. From here on it will apply the alternative ramp value. If 'G5.6 BRK DEC = OFF' no ramp change will occur. **Note:** For drives which input voltage is 400V, the default values will be: - From 6A to 48A =10%/sec - From 60A to 170A =5%/sec - From 210A to Imax =2%/sec	YES
5 BRK ACC=OFF BREAKPOINT ACL	**G5.5** / Speed for acceleration ramp change	OFF, 0 to 250%	This parameter sets the break frequency for the alternative acceleration ramp. This parameter should be set at to the speed at which a change in the acceleration profile is required. If this value is exceeded the drive will start to apply the value of the alternative acceleration ramp. **Note:** Alternative acceleration and deceleration can be selected through the digital inputs or comparator output functions. This functionality is independent of the drive speed (for example, if the magnitude of the comparator is the drive rated current, when the drive output current exceeds a defined level, calculated as % of In, a ramp change occurs).	YES
6 BRK DEC=OFF BREAKPOINT DCL	**G5.6** / Speed for deceleration ramp change	OFF, 0 to 250%	This parameter sets the break frequency for the alternative deceleration ramp. This parameter should be set at to the speed at which a change in the deceleration profile is required. If this value is exceeded, the drive will start to apply the value of the alternative deceleration ramp. **Note:** Alternative acceleration and deceleration can be selected as needed through the digital inputs or comparator output functions. This functionality is independent of the drive speed (for example, if the magnitude of the comparator is the drive rated current, when the drive output current is below a defined level, calculated as % of In, a ramp change occurs).	YES
7 MP I1=1.0%/s MOTO POT INC1	**G5.7** / Ramp 1 of reference increase for motorized pot.	0.01 – 650% / sec	Allows adjustment of ramp 1 reference increase when using the motorized potentiometer function.	YES
8 MP D1=3.0%/s MOTO POT DEC1	**G5.8** / Ramp 1 of reference decrease for motorized pot.	0.01 – 650% / sec	Allows adjustment of ramp 1 reference decrease when using the motorized potentiometer function.	YES
9 MP I2=1.0%/s MOTO POT INC2	**G5.9** / Ramp 2 of reference increase for motorized potentiometer	0.01 – 650% / sec	Allows user to set the ramp 2 reference increase for the motorized potentiometer function. The drive will apply the ramp 1 rate until the value set in 'G5.11 PMOT BRK' is exceeded. From here on it will apply the alternative ramp value. If 'G5.11 PMOT BRK = OFF', no ramp change will occur.	YES
10 MPD2=3.0%/s MOTO POT DEC2	**G5.10** / Ramp 2 of reference decrease for motorized potentiometer	0.01 – 650% / sec	Allows user to set the ramp 2 reference decrease for the motorized potentiometer function. The drive will apply the ramp 1 rate until below the value set in 'G5.11 PMOT BRK'. From here on it will apply the alternative ramp value. If 'G5.11 PMOT BRK = OFF', no ramp change will occur.	YES
11 MPOTBRK = OFF MOTO POT BRKPOIN	**G5.11** / Speed for ramp change with motorized pot.	OFF=0 to 250%	This parameter sets the break frequency for the alternative acceleration and deceleration reference ramp when using motorized potentiometer. This parameter is the speed at which the change in motorized potentiometer reference ramp profile takes place.	YES
12 SP FLT= OFF SMOOT SPD FILTER	**G5.12** / Time constant to filter the speed	OFF, 0.0 – 80.0%	Percentage of the acceleration ramp where the S - filter will be applied. S-Curve can be introduced if smoother performance during acceleration and deceleration is required. S-Curve introduces a filter for speed reference changes during 'Start/Stop' and acceleration and deceleration. It is especially useful in cranes and elevators.	YES

4.10. Group 10 – G10: Limits

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 MIN1 SP= 0% **SPEED MIN LIMIT1**	**G10.1** / Minimum speed limit 1	-250% to Max speed 1	This sets the minimum speed limit 1 that can be applied to the motor by the drive. It is set in percentage of motor rated speed.	YES
2 MAX1 SP=+100% **SPEED MAX LIMIT1**	**G10.2** / Maximum speed limit 1	Min. speed 1 to +250%	This sets the maximum speed limit 1 that can be applied to the motor by the drive. If the reference is higher than the value set in this parameter, the drive will ignore that reference and will operate the motor at the value set in this screen. It is set in percentage of motor rated speed.	YES
3 MIN2 SP=-100% **SPEED MIN LIMIT2**	**G10.3** / Minimum speed limit 2	-250% to Max speed 2	This sets the minimum speed limit 2 that can be applied to the motor by the drive. It is set in percentage of motor rated speed. **Note:** Selection of minimum speed limit 2 is done via a digital input or comparator output function.	YES
4 MAX2 SP=+100% **SPEED MAX LIMIT2**	**G10.4** / Maximum speed limit 2	Min. speed 2 to +250%	This sets the maximum speed limit 2 that can be applied to the motor by the drive. If the reference is higher than the value set in this parameter, the drive will ignore that reference and will operate the motor at the value set in this screen. It is set in percentage of motor rated speed.	YES
5 I LIMIT=___A (*) **MAX CURRENT**	**G10.5** / Current limit	0.25 to 1.50In, OFF	Output current limit. Motor current will be within this programmed limit. When this protection is active the SD700 status of current limitation (ILT) is displayed. **Note:** We do not recommend that current limit works constantly in applications when the motor is at steady speed status. Damage may occur to the motor and torque variations can affect the load. Current limit should work only when an overload occurs, or due to excessive acceleration and deceleration values, or because motor data details are entered incorrectly.	YES
6 I LIM TO= OFF **TIMOUT MAX CURRE**	**G10.6** / Trip time because of current limit	0 to 60s, OFF	If the drive is operated continually at current limit for the time set in this screen the drive generates a fault.	YES
7 I. MAX2=____A (*) **MAX CURRENT 2**	**G10.7** / Alternative current limit	0.25 to 1.50In, OFF	This limit operates with the same philosophy than G10.5, but for the second current limit.	YES
8 MI2 brSP=OFF **MAX CURR BRK SPD**	**G10.8** / Change speed for Imax 2	OFF=0%, +1 to +250%	It allows setting the speed level to change from current limit 1 to current limit 2. Additionally it is possible to select the alternative current limit 2 using a digital input configured as option 23.	YES
9 MAX TOR=+150% **MAX TORQUE**	**G10.9** / Torque limit	0% to +250%	This value is the maximum motor torque the drive will allow the motor to supply to the load. It is set in percentage of motor rated torque.	YES
10 T LIM TO=OFF **TIMEOUT MAX TORQ**	**G10.10** / Trip time because of torque limit	0 to 60s, OFF	If the drive is operated continually at torque limit for the time set in this screen the drive generates a fault.	YES
11 INVERSION ?=N	**G10.11** / To enable speed inversion	N Y	The drive can be configured to prevent the motor running in negative direction. **OPT.** / **FUNCTION** N=NO – Motor running in negative rotation direction is not allowed. Y=YES – Motor running in both rotation directions is allowed.	YES
12 ILIM RGN=OFF **CURR.LIMIT.RGN**	**G10.12** / Regenerating current limit	OFF = 40%·In (motor), 40.1% to 200%·In (drive)	Output current limit during regeneration. It keeps the motor load current within the adjusted limit during regeneration. When this protection is active, the display shows that the SD700 is limiting current (ILT). If this parameter is set to 'OFF', the algorithm is not enabled.	YES
13 Ilim_rgnTO=OFF **ILim.Regen.Tmout**	**G10.13** / Regenerating current limit trip time	0 to 60s, OFF	It allows setting the trip time once the current limit is reached.	YES
14 T/I LIM SP = N	**G10.14** / Torque limit algorithm	N Y	It allows disabling of the torque/current limit algorithm. **OPT.** / **FUNCTION** N=NO – Algorithm is enable. By limiting the current or the torque, the equipment reduces its speed. Y=YES – Algorithm is disable but the equipment still using current or torque limit (G10.5 and G10.9) and timeouts (G10.6 and G10.10) which could mean drive trip.	YES
15 Rg TQ L = 150%	**G10.15 /** Torque limit range	0 to 250%	It allows limiting the regenerative torque of the motor.	YES

∗ This value depends on the drive rating.

<tr><td>2 INCH2=+0.00%
INCH SPEED 2</td><td>G15.2 / Inch speed 2</td></tr>
<tr><td>3 INCH3=+0.00%
INCH SPEED 3</td><td>G15.3 / Inch speed 3</td></tr>
</table>

4.16. Group 16 – G16: Skip Frequencies

<table>
<tr><th>Parameter / Default Value</th><th>Name / Description</th><th>Range</th><th>Function</th><th>Set on RUN</th></tr>
<tr><td>1 SKIP 1=+0.0%
SKIP FREQUENCY 1</td><td>G16.1 / Skip frequency 1</td><td>-250% to +250%</td><td>Allows user to select the first skip frequency to avoid resonance frequencies or frequencies where it is not desirable for the motor to operate. Drive passes through this frequency value during acceleration and/or deceleration but will not remain operating at this frequency. Once this value is set, the bandwidth (G16.3) will be based on it, forming a frequency range that the drive will avoid.</td><td>YES</td></tr>
<tr><td>2 SKIP 2=+0.0%
SKIP FREQUENCY 2</td><td>G16.2 / Skip frequency 2</td><td>-250% to +250%</td><td>Allows user to select the second skip frequency to avoid resonance frequencies or frequencies where it is not desirable for the motor to operate. Drive passes through this frequency value during acceleration and/or deceleration but will not remain operating at this frequency. Once this value is set, the bandwidth (G16.3) will be based on it, forming a frequency range that the drive will avoid.</td><td>YES</td></tr>
</table>

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
3 SKIP BAND=OFF **OFFSET BAND**	**G16.3** / Skip bandwidth	OFF=0 to 20%	Sets the skip frequency bandwidth. For example, if 10% is set, the avoided frequencies will be from freq (G16.1) – 5% to freq(G16.1) + 5% and from freq(G16.2) – 5% to freq(G16.2) + 5%. Supposing that the selected range goes from 20% to 30%. In case of the frequency is within that band, for example 27%, there is two situations: a) Drive is accelerating: so the frequency will be increased up to 27%, but it will not remain here, it will be increased up to 30%. b) Drive is decelerating: so the frequency will be decreased down to 27%, but it will not remain here, it will be decreased down to 20%.	YES

4.17. Group 17 – G17: Brake

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 T DC BRAKE=OFF **DC BRAKING TIME**	**G17.1** / Time for DC brake activation	OFF=0.0 to 99s	Allows setting of the time for which the DC brake will be activated.	YES
2 DC CURR=0% **DC CURRENT LEVEL**	**G17.2** / Current applied to the brake	0 – 100%	Allows setting of the current level applied during braking. The proper current value must be set to brake the load inertia correctly. If this value is too much low the load will not be stopped in time. If the value is too high the power components of the drive will be stressed.	YES
3 DC VOLTS=0.0% **DC BR VOLT LEVEL**	**G17.3** / Voltage applied to the brake	0.0 – 25%	Allows setting of the continuous DC voltage level applied during braking. The proper voltage value must be set to brake the load inertia correctly. If this value is too much low load will not be stopped in time. Otherwise, if the value is too high the power components of the drive will be stressed.	YES
4 I HEATING=OFF **Idc HEATING**	**G17.4** / Non condensing heating current	OFF=0.0 to 30%	Set a suitable value to avoid humidity or condensation forming in the motor. **Note:** Modify this parameter only if necessary. ⚠ **CAUTION:** Although the motor is not running there is dangerous voltage. Run Led will be lit during this process. Be careful to avoid property damage and personal injuries.	YES
5 DYN BRAK=N	**G17.5** / Use of external brake	N Y	User must configure the drive if an external dynamic brake is going to be used. **OPT.** / **FUNCTION** N=NO / External brake is not used. Y=YES / External brake is going to be installed.	NO

4.18. Group 18 – G18: Encoder

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
0 ENCODER =N	**G18.0** / Encoder	N Y	**OPT** / **FUNCTION** N / The Encoder is enabled Y / The Encoder is disabled	YES
1 PULSES=1024	**G18.1** / Pulses per revolution of the encoder	200 to 8191	Set the encoder installed in the motor pulses per revolution	NO
2 TYPE=DIFF	**G18.2** / Encoder Type	DIFF SING	Select the type of encoder installed in the motor **OPT.** / **FUNCTION** DIFF / Differential output encoder SING / Single-ended output encoder	NO
3 ENCOD FILTER=N	**G18.3**/ Encoder filter selection	N Y	Filters the encoder signal	NO

ENGLISH

4.19. Group 19 – G19: Fine Tuning

4.19.1. Subgroup 19.1 – S19.1: IGBT Control

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 TYPE CTRL=V/Hz	**G19.1.1** / Selection of control type	V/Hz VECT	This selection defines the drive control type. **OPT.** / **FUNCTION** V/Hz – Scalar control mode. Drive carries out the control applying a voltage / frequency ramp to the motor. VECT – Vector Control.	YES
2 VECTOR CTR = PMC **(*) Available if G19.1.1 = VECT**	**G19.1.2** / Vector Control mode	PMC AVC	Set the vector control mode: **OPT.** / **FUNCTION** PMC – Power Motor Control. AVC – Advance Vector Control.	NO
3 PMC = OL SP **(*) Available if G19.1.1 = VECT and G19.1.2 = PMC**	**G19.1.3** / Power Motor Control mode	OL SP OL TQ CL SP CL TQ	Set the Power Motor Control mode: **OPT** / **FUNCTION** OL SP – Open Loop Speed Control. OL TQ – Open Loop Torque Control. CL SP – Close Loop Speed Control. CL TQ – Close Loop Torque Control.	NO
4 AVC = CL SP **(*) Available if G19.1.1 = VECT and G19.1.2 = AVC**	**G19.1.4** / AdvanceVector Control mode	CL SP CL TQ	Set the Advance Vector Control mode: **OPT.** / **FUNCTION** CL SP – Close Loop Speed Control. CL TQ – Close Loop Torque Control.	NO
5 FREQ=4000Hz **MODULAT FREQUENC**	**G19.1.5** / Commutation frequency	4000 – 8000 Hz	It allows modification of the drive switching frequency. This function can be used to reduce audible motor noise.	YES
6 PEWAVE=Y	**G19.1.6** / Pewave control	N Y	This control mode improves motor noise tone. **OPT.** / **FUNCTION** N=NO – Pewave control deactivated. Y=YES – Pewave control activated. Commutation frequency (G19.1.2) is slightly modified on a random basis to improve the noise tone generated by the motor.	YES
8 Autotune=N	**G19.1.8** / Motor parameter auto-tuning	N Y	This selection allows executing a motor auto-tuning, in order to get the stator resistance value of the motor. This value will be saved in parameter G19.3.1.	YES
9 OVERMODULATIO=N	**G.19.1.9** / Over-modulation	N Y	With this option, it allows supplying more motor voltage at 50Hz.	YES

4.19.2. Subgroup 19.2 – S19.2: Motor Load

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 MIN FLUX = 100% **MINIMUM FLUX**	**G19.2.1** / Minimum Flux	40 – 100%	Allows setting of the minimum flux level used by the motor during low load conditions. With this dynamic system of flux optimization, noise and power losses are reduced. Adaptation of the flux level during low load conditions occurs automatically. The algorithm will be disabled when this parameter is set to 100%.	YES
3 V BOOST = 0.0%	**G19.2.3** / Initial voltage	0.0 to 100%	Sets an initial voltage value applied to the motor during the starting. Using this function it is possible to improve breakaway torque when starting heavy loads. **Note:** Set a low value first. Increase the value gradually until the load starts easily.	YES
4 SLIP COMPENS=N	**G19.2.4** / Slip compensation	N Y	If this function is active, it helps to compensate the slip on the motor. In case of heavy load able of provoking a high slip during the starting, set this parameter to YES.	YES

<table>
<tr><th>Parameter / Default Value</th><th>Name / Description</th><th>Range</th><th>Function</th><th>Set on RUN</th></tr>
<tr><td>7 I SLIP=2.0%(*)
I SLIP COMPENSAT</td><td>G19.2.7 / Current limit factor</td><td>0.0 – 20.0%</td><td>Modifies the speed by reducing the output frequency to keep the output current within a controllable margins (display shows ILT). Adjusting this parameter can improve the stability of the current limit function taking the motor slip into account.
Note: The following table shows the default values for drives of any nominal voltage.

<table>
<tr><th colspan="2">Default Values for All Powers</th></tr>
<tr><th>G2.3 Motor Power (kW)</th><th>Value (%)</th></tr>

4.19.3. Subgroup 19.3 – S19.3: Motor Model

<table>
<tr><th>Parameter / Default Value</th><th>Name / Description</th><th>Range</th><th>Function</th><th>Set on RUN</th></tr>
<tr><td>1 R. STR=1%
STATOR RESISTOR</td><td>G19.3.1 / Stator resistance (Rs)</td><td>0.0 to 9.9%</td><td rowspan="4">Set as a percentage of motor rated impedance.
Stator resistance (Rs): It is used to compensate the iron losses and copper losses of the motor.
Rotor resistance (Rr): A key parameter that directly concerns the output torque.
Motor inductance (Lm): It is an interesting parameter if the equipment works with vector control and G19.1.2 = AVC. It is the main inductance of the motor that defines the magnetic field strength. It is a key parameter that directly concerns the motor flux. Typical values can range from 75% (small motors) to 800% (large motors).
Note: The following table shows the default values for drives of any nominal voltage.
Default Values for All Powers
G19.3.4 = 5% of G19.3.3

Adjust mode: When initializing factory settings (1) or manually modifying the Motor Nominal Power (G2.3) (2), the values are initialized according to the table, values outside the table are estimated according to the table.
When auto-tuning is performed (G19.1.8) (3) the value of parameters is automatically changed to the value measured.
In all cases, the adjustment range is + / -30% of initialized value in any of the three scenarios given (1), (2), (3).

Note: If this G19.3.1 is set too high then increased motor currents can reach the current limit preventing further acceleration to the motor. We recommend consulting the above standard value table as Rs value is variable according to the drive capacity.</td><td rowspan="3">YES</td></tr>
<tr><td>2 R. RTR = 0%</td><td>G19.3.2 / Rotor resistance (Rr)</td><td>0.0% to 15%</td></tr>
<tr><td>3 Lm = 40%</td><td>G19.3.3 /Motor inductance (Lm)</td><td>40% to 800%</td></tr>

4.19.4. Subgroup 19.4 – S19.4: Control PID

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 Kp Sp = 95% (*) Available if the drive is in speed mode	**G19.4.1 /** Speed closed loop proportional constant.	0.0% to 100%	Allows the setting of the proportional gain value of the speed regulator. If a greater control response is needed, this value has to be increased. **Note:** When increasing too much this value, the system can be l destabilized.	YES
2 Ki Sp= 95% (*) Available if the drive is in speed mode	**G19.4.2** / Speed closed loop integration time setting.	0.0% to 100%	Allows the adjustment of the integration time of the speed regulator. In the event of needing more precision, this value has to be increased. **Note:** When increasing this value too much, the system can get slower.	YES
3 Kp Tq = 95% (*) Available if the drive is in torque mode	**G19.4.3** / Torque proportional closed loop constant.	0% to 100%	Allows setting the value of the proportional gain of the overcurrent regulator. If a greater control response is needed this value has to be increased. **Note**: When increasing too much this value, the system can become more unstable.	YES
4 Ki Tq = 95% (*) Available if the drive is in torque mode	**G19.4.4 /** Torque closed loop time setting.	0% to 100%	Allows the adjustment of the integration time of the overcurrent regulator. In the event of needing more precision, this value has to be increased. **Note:** When increasing this value too much, the system can get slower.	YES
5 Kp I = 95% (*) Available if G19.1.1=VECT and G19.1.2 = PMC	**G19.4.5** / Current closed loop proportional constant	0.0% to 100%	Allows the setting of the proportional gain value of the flow regulator.	NO
6 Ki I = 15% (*) Available if G19.1.1=VECT and G19.1.2 = PMC	**G19.4.6 /** Current closed loop integration time setting.	0.0% to 100%	Allows the adjustment of the integration time of the flow regulator	NO
9 Flux tune=2.0% (*) Available if G19.1.1=VECT and G19.1.2 = PMC	**G19.4.9** / Flux tuning	0.0% to 10%	Allows to set a greater starting torque in the device. **Note:** Fault "F39 BLOCKED rotor" when giving the boot order means that the device hasn't got enough torque for the load. The user will have to set a higher value. Once this value has been set to its maximum, if the motor doesn't move it will probably mean that the resistant torque is too high for the device, or there is a mechanical problem.	YES

4.20. Group 20 – G20: Communication Buses

4.20.1. Subgroup 20.0 – S20.0: Communications Control

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 COM. CONTROL = 0	**G20.0.1** / Communications Control	0-6	Selection of the communication bus through which the equipment is controlled OPC. / FUNCIÓN 0 Modbus 1 Profibus 2 Modubus TCP 3 Ethernet IP 4 Can Open 5 Devicenet 6 OFC **Note:** This parameter is only functional after the boot up.	NO

4.20.2. Subgroup 20.1 – S20.1: Modbus RTU

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 COMMS T/O =OFF COMMS TIMEOUT	**G20.1.1** / Communication timeout MODBUS RTU	OFF=0 to 250s	If this time has elapsed from the last valid data transmission a communication timeout trip can be generated if the user requires it. Serial communication with the drive is possible through RS232 terminals, RS485 terminals, or through optional serial communication interfaces. **Note:** Do not modify this parameter if is not necessary.	YES
2 COMM ADDR =10 COMM ADDRESS	**G20.1.2** / Communication address	1 to 255	Sets the identification address assigned to the drive for communication via the Modbus network. If communication is required with several drives a different address is required for each unit.	YES

ENGLISH

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
3 BAUDS=9600	**G20.1.3** / Communication speed	600 1200 2400 4800 9600 19200	Sets the data transmission speed for MODBUS serial communications. This rating should be the same as the rating of the master of the communication bus on which the drive is integrated.	YES
4 PARITY=NONE	**G20.1.4** / Communication parity	ODD NONE EVEN	MODBUS parity setting. Used for data validation. If you do not want to validate data, set this parameter to 'NONE'. Parity selection should be the same as the parity of the master of the communication bus on which the drive is integrated.	YES
DispBR= 4800	Display communication speed	1200 2400 4800 9600	Set the baud rate of the communication between the display and the control power board.	YES

4.20.3. Subgroup 20.2 – S20.2: PROFIBUS (*)

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 NODE ADDR=10 **NODE ADDRESS**	**G20.2.1** / Slave address in Profibus network	1 to 255	Sets the identification address assigned to the drive for communication via Profibus network. If communication is required with several drives a different address is required for each unit.	YES

(*) **Note**: Available if G20.0.1 = 1 Profibus

4.20.4. Subgroup 20.3 – S20.3: CANOPEN (*)

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 CO NODEID=0	**G20.3.1** / Canopen slave address	0 to 127	The Node slave address is assigned	YES
2 CO BAUD=1Mbps	**G20.3.2** / Bus speed connected to drive	125Kbps 250Kbps 500Kbps 1Mbps	Set the bus speed at which the drive will be connected.	YES
3 CO REF sp=+0.0%	**G20.3.3** / Canopen Speed		Display screen through which the speed referenced can be seen through the Canopen	YES

(*) **Note**: Available if G20.0.1 = 4 CanOpen

4.20.5. Subgroup 20.4 – S20.4: DEVICENET (*)

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 DN MAC ID=0	**G20.4.1** / Devicenet MAC ID	0 to 63	DeviceNet MAC ID setting. Each device must be assigned a unique MAC ID within the network. MAC ID can be changed at any time, but it will come into effect after power-cycling the drive. The default value is 0x00..	YES
2DNBaud=500Kbps	**G20.4.2** / Devicenet Baud rate	125Kbps 250Kbps 500Kbps	Choose the DeviceNet Baud Rate (set by Master device) **OPTIONS** / **DESCRIPTION** 0 / 125 Kbps 1 / 250 Kbps 2 / 500 Kbps DeviceNet Baud Rate can be changed at any time, but it will come into effect after power-cycling the drive.	YES

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
01 Reg01 = 40001	**G20.6.1** / Register 1	40001 to 45400	It allows the user to have the modbus address that he wants in each register. In this way he will have consecutive Modbus addresses that are interesting for him and in this way the communication will be optimal.	YES
02 Reg02 = 40001	**G20.6.2** / Register 2			
03 Reg03 = 40001	**G20.6.3** / Register 3			
04 Reg04= 40001	**G20.6.4** / Register 4			
.....	**……..**			
31 Reg31 = 40001	**G20.6.31** / Register 31			

4.20.8. Subgroup 20.7 – S20.7: Vis Regist

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
01 Reg01 = 0	**G20.7.1** / Register 1	0 to 65535	It allows the user to view and write (if the parameter is writing allowed) the values of the configured addresses in the subgroup 'G20.6 Registers'.	YES
02 Reg02 = 0	**G20.7.2** / Register 2			
03 Reg03 = 0	**G20.7.3** / Register 3			
04 Reg04= 0	**G20.7.4** / Register 4			
.....	**……..**			
31 Reg31 = 0	**G20.7.31** / Register 31			

4.21. Group 21 – G21: Networks

This parameter group is used to configure the drive when it should operate in Ethernet network.
Note: This parameter group and its corresponding subgroups will be only available when the Ethernet board is connected to the drive.

4.21.1. Subgroup 21.1 – S21.1: ETHERNET

This parameter subgroup is used to configure the identification parameters of the drive in the Ethernet network (IP, Subnet Mask, Gateway), and the MAC address.

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 AUTOMATIC IP=Y	**G21.1.1** / To enable automatic assignation of parameters	N Y	It allows the possibility of assigning the parameters automatically. OPT. / FUNCTION N=NO – The drive will take IP, Subnet Mask and Gateway addresses set by user from subgroup S21.1. Y=YES – The drive request and receives the parameters of the IP, Subnet Mask and Gateway addresses from the Network Server. To achieve this, it is used DHCP protocol.	YES
Ixxx.yyy.zzz.hhh	Present IP address of the drive	-	It shows the IP address assigned to the drive automatically or set by the user from the parameters G21.1.2, G21.1.3, G21.1.4 and G21.1.5.	-
Sxxx.yyy.zzz.hhh	Present Subnet Mask of the drive	-	It shows the Subnet Mask address assigned to the drive automatically or set by the user from parameters G21.1.6, G21.1.7, G21.1.8 and G21.1.9.	-

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
Gxxx.yyy.zzz.hhh	Present Gateway of the drive	-	It shows de Gateway address assigned to the drive automatically or set by the user from parameters G21.1.10, G21.1.11, G21.1.12 and G21.1.13.	-
2 IP MANU. A=192[6]	**G21.1.2** / IP address (A)	0 to 255	Setting of the IP address assigned to the equipment in the local network of the user. This address must be provided by the network administrator of the own user. The format of the IP address is the following one: A.B.C.D. Therefore, the setting of this address is realized by introducing a value in each parameter that configures the complete address, this is, by assigning a value to each one of the 4 parameters (from parameter G21.1.2 to the parameter G21.1.5).	YES
3 IP MANU. B=168[6]	**G21.1.3** / IP address (B)	0 to 255		YES
4 IP MANU. C=1[6]	**G21.1.4** / IP address (C)	0 to 255		YES
5 IP MANU. D=143[6]	**G21.1.5** / IP address (D)	0 to 255		YES
6 SUBNET A=255[6]	**G21.1.6** / Subnet Mask address (A)	0 to 255	Setting of the Subnet Mask address of the local network of the user. This address must be provided by the network administrator of the own user. The format of the Subnet Mask address is the following one: A.B.C.D. Therefore, the setting of this address is realized by introducing a value in each parameter that configures the complete address, this is, by assigning a value to each one of the 4 parameters (from parameter G21.1.6 to the parameter G21.1.9).	YES
7 SUBNET B=255[6]	**G21.1.7** / Subnet Mask address (B)	0 to 255		YES
8 SUBNET C=255[6]	**G21.1.8** / Subnet Mask address (C)	0 to 255		YES
9 SUBNET D=0[6]	**G21.1.9** / Subnet Mask address (D)	0 to 255		YES
10 GATEWAY A=0[6]	**G21.1.10 / Gateway address (A)**	0 to 255		YES
11 GATEWAY B=0[6]	**G21.1.11 /** Gateway address (B)	0 to 255		YES
12 GATEWAY C=0[6]	**G21.1.12 /** Gateway address (C)	0 to 255		YES
13 GATEWAY D=0[6]	**G21.1.13 /** Gateway address (D)	0 to 255		YES
14 MAC A=0	**G21.1.14 /** MAC address (A)	0 to 255		YES
15 MAC B=80	**G21.1.15 /** MAC address (B)	0 to 255		YES
16 MAC C=194	**G21.1.16 /** MAC address (C)	0 to 255		YES
17 MAC D=114	**G21.1.17 /** MAC address (D)	0 to 255		YES
18 MAC E=X	**G21.1.18 /** MAC address (E)	0 to 255		YES
19 MAC F=Y	**G21.1.19 /** MAC address (F)	0 to 255		YES

[6] This parameters will be only available if 'G21.1.1 AUTOMATIC IP = N'.

4.21.2. Subgroup 21.2 – S21.2: MODBUS TCP

Parameter / Default Value	Name / Description	Range	Function	Set on RUN
1 MIPtout=OFF MODBUS TCP TOUT	**G21.2.1** / Communication timeout MODBUS TCP	OFF=0 to 600s	When the equipment is powered, if this parameter is set to OFF (this means, set to some value), the drive will wait for the first communication frame during one minute without considering the set value. If during this minute a Modbus request is produced by the Master, the equipment will response, and from this moment on, the time without communication will be the value set in this parameter, but if during the first minute the equipment does not receive any correct Modbus frame, the drive will trip because of communication fault. **Note:** Do not modify the value of this parameter if it is not necessary.	YES

5. MODBUS COMMUNICATION

5.1. Supported Modbus Function Codes

Serial communications protocol provided by SD700 drive adheres to Modbus Industrial standard communications protocol of Modicon. The drive uses reading and writing functions between all of the functions that exist in Modbus protocol. The used functions by the drive are the following ones:

Function	Description	Registers Number
3	Registers Reading	120
16	Registers Writing	120

The implementation of this function code in the drive allows reading up to 120 registers into a Parameters Group in a frame. If you want to access to a consecutive memory registers, but belonging to different groups, you should access in so many frames as groups are involved.

5.1.1. Modbus Function Code Nº 3: Registers Reading

This function code allows the Modbus controller (master) to read the content of the data registers indicated in the drive (slave). This function code only admits unicast addressing. Broadcast or groupcast addressing are not possible with this function code.

The implementation of this function code in the drive allows reading up to 120 registers with consecutive addresses of the drive in a single frame.

Next, a frame is shown where the master tries to read the content of 3 registers of a drive where the current used by each phase is. The information that should be attached in the ask frame is the following one:

- Data address of the drive.
- Modbus function code (3 Registers reading).
- Starting Data address.
- Registers number for reading.
- CRC-16 code.

The answer of the drive (slave) should contain the following fields:

- Data address of the slave.
- Modbus function code (3 Registers reading).
- Bytes number for reading.
- Bytes number / 2 registers.
- CRC-16 code.

Each register consists of 2 bytes (2x8bits=16 bits). This one is the default length of all of the registers that form the SD700.

ENGLISH

5.1.1.1. Operation Example of Modbus Function Code Nº 3 (Registers Reading)

We suppose that we want to read the motor current (nameplate data) via communications. This data corresponds to the parameter G2.1 '1 MTR CUR=00.00A'. The frame that should be transmitted is:

Modbus Address	Modbus Function Code	Starting Data Address (40282)	Registers Number	CRC-16
0x0A	0x03	0x0119	0x0001	0x2493

We suppose that instantaneous current of the equipment is 8,2 A. (Modbus value 82 decimal = 0x52 Hexadecimal). The answer of the slave will be:

Modbus Address	Modbus Function Code	Bytes Number	Data (address 20) (=110)	CRC-16
0x0A	0x03	0x02	0x0052	0x9C78

5.1.2. Modbus Function Code Nº 16: Registers Writing

This function code allows the Modbus controller (master) to write the content of the data registers indicated in the drive (slave), whenever those registers are not of Read only. Registers writing by the master does not impede the later modification of those registers by the slave.
The implementation of this function code in the drive allows writing up to 5 registers of the drive in a single frame.

Next, a frame is shown where the master tries to write the content of 1 register that stores the acceleration time. The information that should be attached in the ask frame is the following one:

- Data address of the slave.
- Modbus function code (16 Registers writing).
- Starting Data Address.
- Registers number for writing.
- Bytes number for writing.
- Content of registers for writing.
- CRC-16 code.

The answer of the slaves includes:

- Data address of the slave.
- Modbus function code (16 Registers writing).
- Starting Data Address.
- Written registers number.
- CRC-16 code.

5.2. Addressing Modes

5.2.1. Broadcast Addressing Mode

Broadcast addressing mode allows the master to access at the same time to all of the slaves connected to the Modbus network. The Modbus function code that admits this global addressing mode is:

Function	Description
16	Registers Writing

In order to access to all of the equipments connected in a Modbus network, you must use the address 0.
When this address is used, all of the slaves in the Modbus network make the required task but they do not prepare any answer.

5.3. Remote Control Functions

HOST START CONTROL

Screen	**-**
Range	0 – 1
Modbus address	**40562**
Modbus range	0 to 1
Read / Write	YES
Description	It allows giving the start command to the equipment through communications network.

HOST STOP CONTROL

Screen	**-**
Range	0 – 1
Modbus address	**40563**
Modbus range	0 to 1
Read / Write	YES
Description	It allows giving the stop command to the equipment through communications network.

HOST RESET CONTROL

Screen	**-**
Range	0 – 1
Modbus address	**40564**
Modbus range	0 to 1
Read / Write	YES
Description	It allows giving the reset command to the equipment through communications network.

HOST TRIP CONTROL

Screen	**-**
Range	0 – 1
Modbus address	**40565**
Modbus range	0 to 1
Read / Write	YES
Description	It allows the equipment to generate a fault through communications network.

HOST COMMS CONTROL

Screen	**-**
Range	-20480 to +20480
Modbus address	**40128**
Modbus range	-20480 to +20480
Read / Write	YES
Description	It allows the assignment of the speed reference through communications network.

5.4. Summary of Modbus Addresses

5.4.1. Modbus Register 'GENERAL STATUS'

This register supplies information about the general status of the drive, as the following table shows:

Modbus Address	Bit	Description	Meaning on '0'	Meaning on '1'
40558	0	RUN	Drive stopped	Drive running
	1	FAULT	No Fault	Fault
	2	WARNING	No Warning	At least one warning present
	3	READY	The drive is not ready to start (any fault or warning is present)	The drive is ready to start (no fault and no warning)
	4	EXTERNAL POWER SUPPLY	The drive is powered through internal power supply	The drive is powered through external power supply
	5	DELAYING START	Not delaying start	Delaying start
	6	MOTOR OVERLOAD	Motor overload warning (MOL) is not active	Motor overload warning (MOL) is active
	7	MOTOR OVERLOAD FAULT	Motor overload fault (F25) is not present	Motor overload fault (F25) is present
	8	RESERVED	Reserved	Reserved
	9	DRIVE AT SET SPEED	Motor speed is different to the reference speed	Motor speed has reached the value set as reference
	10	CURRENT LIMIT	Current limitation warning (ILT) is not present	Current limitation warning (ILT) is present
	11	VOLTAGE LIMIT	Voltage limitation warning (VLT) is not present	Voltage limitation warning (VLT) is present
	12	TORQUE LIMIT	Torque limitation warning (TLT) is not present	Torque limitation warning (TLT) is present
	13	COMPARATOR 1	Comparator 1 is 'OFF'	Comparator 1 is 'ON'
	14	COMPARATOR 2	Comparator 2 is 'OFF'	Comparator 2 is 'ON'
	15	COMPARATOR 3	Comparator 3 is 'OFF'	Comparator 3 is 'ON'

5.4.2. Programming Parameters

Parameter	Screen	Description	Address	Range	Modbus Range

Note: See description of the fault messages in section 11.

STATUS LINE	OFF **0.0A** +0.0%	Motor output current. (Corresponds with SV1.6)	**40163**	Real value = (Modbus value / 10)
STATUS LINE	OFF 0.0A **+0.0%**	Motor output speed (in %). (Corresponds with SV1.3).	**40170**	8192 = 100% of motor rated speed

Note for drive status

Equipment status.
Parameter Equipment Status has Word size like the rest of Modbus parameters.
The information of the previous tables about status messages, warning and fault messages will be displayed by means of the Low Byte (LSB).
The High Byte (MSB) is reserved for internal use (bit by bit). Interesting information for the user is below:

- Bit 15:
  - 0 ➔ Drive with no fault.
  - 1 ➔ Drive in fault status.
- Bit 12:
  - 0 ➔ Drive started.
  - 1 ➔ Drive stopped.

Alternation between two states.
During the standard running of the equipment, the drive status value will appear in a stable and continuous way, only changing when the drive status changes (from 'ACL' (Accelerating) to 'RUN', for example). Nevertheless, there are two situations where the status value intermittently alternates between two states:

- First case: If the equipment presents a warning, this one will appear by alternating with the equipment status, for example, normal status 'RUN' and the warning 'ILT' will be alternatively and intermittently displayed.
- Second case: If a fault occurs, the last status value before the fault has occurs will be shown in alternation with the present fault number. For example, normal status 'RUN' and 'F40' will be alternatively and intermittently displayed.

Parameter	Screen	Description	Address	Modbus Range
SV1.1	Sp Ref =+000%	Value of present speed reference.	**40162**	8192 = 100% of motor rated speed
SV1.2	Tq Ref=000	Torque Reference Value	**41316**	-20480 to +20480
SV1.3	Mtr Speed = +0rpm	It shows the motor speed in rpm.	**40169**	Real value = Modbus value
SV1.4	Mtr Sp = +0.0%	It shows the motor speed in %.	**40170**	8192 = 100% of motor rated speed
SV1.5	Mtr Freq = +0.0Hz	Frequency at which motor is running.	**40167**	Real value = Modbus value
SV1.6	Mtr Vout = 0V	It shows the present voltage applied to the motor.	**40166**	Real value = Modbus value
SV1.7	Mtr Iout = 0.0A	Present current flowing to the motor.	**40163**	Real value = (Modbus value / 10)
SV1.8	Mtr Torqe = 0.0%	It shows the present torque applied to the motor.	**40164**	8192 = 100% of motor rated torque
SV1.9	Mtr Pfactr = 0.0	It shows the power factor of the motor.	**40168**	Real value = (Modbus value / 10)
SV1.10	Mtr Pwr = +0.0kW	Instantaneous power consumption of the motor.	**40165**	Real value = (Modbus value / 10)
SV1.11	0.0A 0.0A 0.0A	Instantaneous current per phase of the motor (U, V y W).	**40177 → U** **40178 → V** **40179 → W**	Real value = (Modbus value / 10)
SV1.12	Vmt= 0 0 0V	Compound Instantaneous voltage (UV, VW, UW).	**40180 → UV** **40181 → VW** **40182 → UW**	Real value = Modbus value
SV1.13	PTC Motor = 0	It shows if the motor PTC is connected or not.	**40218**	0 to 1
SV1.14	Motor T. = 0.0%	Theoretical heating level of the motor.	**40173**	8192 = 100% of motor temperature
SV1.15	Enco. Pulso = 0	It shows the encoder pulses	**40337**	Real value = Modbus value
SV1.16	Clsped = 0 rpm	Real speed measured by the encoder	**40336**	Real value = Modbus value
SV2.1	390 390 390V	Input instantaneous voltage.	**40183 → RS** **40184 → ST** **40185 → RT**	Real value = Modbus value
SV2.2	Inp Vol = 390V	Average input voltage to the drive.	**-**	Non accessible from this SW version
SV2.3	50.0 50.0 50.0Hz	Frequency of input voltage.	**40159 → RS** **40160 → ST** **40161 → RT**	Real value = (Modbus value / 10)
SV2.4	Bus vol = 540V	DC Link voltage of the drive.	**40171**	Real value = Modbus value
SV2.5	IGBT Temp =+23ºC	Temperature measured at the power stage.	**40172**	Real value = Modbus value
SV2.6	Drive Temp =+26ºC	Internal temperature of the drive.	**40240**	Real value = (Modbus value / 100)
SV3.1	ANLG IN1 = +0.0V	Average value of the Analogue Input 1.	**40186**	Real value = (Modbus value / 1000)
SV3.2	AIN1 Refr = +0.00%	Speed reference or PID setpoint proportional to the AI1.	**40190**	8192 = 100% maximum range of the Analogue Input 1
SV3.3	AIN1 S = +0.00l/s	Value of sensor 1 associated to the AI1.	**40262**	Real value = (Modbus value / 10)
SV3.4	ANLG IN2 = +0.0V	Average value of the Analogue Input 2.	**40187**	Real value = (Modbus value / 1000)
SV3.5	AIN2 Refr = +0.00%	Speed reference or PID setpoint proportional to the AI2.	**40191**	8192 = 100% maximum range of the Analogue Input 2
SV3.6	AIN 2 S = +0.00Bar	Value of sensor 2 associated to the AI2.	**40263**	Real value = (Modbus value / 10)
SV3.7	ANL OUT1 = +4.0mA	It shows the value of the Analogue Output 1.	**40192**	Real value = (Modbus value / 1000)
SV3.8	AOUT1 Refer = +0.0%	Value of the magnitude associated to the AO1.	**40194**	8192 = 100% maximum range of the Analogue Output 1
SV3.9	ANL OUT2 = +4.0mA	It shows the value of the Analogue Output 2.	**40193**	Real value = (Modbus value / 1000)
SV3.10	AOUT2 Refer = +0.0%	Value of the magnitude associated to the AO2.	**40195**	8192 = 100% maximum range of the Analogue Output 2
SV3.11	DI: 000000 0	Digital Inputs and PTC status.	**40196**	LSB → BIT0 → MFI1 BIT6 → PTC 0 to 1
SV3.12	Relays 1-3: X0X	Output relays status.	**40197**	BIT 0 → R1; Range from 0 to 1 BIT 1 → R2; Range from 0 to 1 BIT 2 → R3; Range from 0 to 1
SV3.13	Speed M = +0.000m/s	Machine speed associated to the motor (speed motor in engine. Units).	**-**	
SV3.14	Modbus Traffic:O	Traffic in user port (Modbus RTU)	**40418**	0 to 1
SV3.15	Display_traffi = 0	Presence of the Display Unit	**40422**	0 to 1
SV4.1	Actual Fault = 00	Present code fault.	**40235**	Fault number
SV4.2	Drive Curr = 170A	Drive rated current.	**40209**	Real value = (Modbus value / 10)
SV4.3	Drive Volt = 400V	It shows the drive rated voltage.	**40210**	Real value = (Modbus value / 10)
SV4.4	S/W	Software version installed into the equipment.	**40206**	Real value = Modbus value
SV4.5	H/W y.y	It shows the hardware version of the equipment.	**40207**	Real value = (Modbus value / 100)
SV4.6	PID R% = +0.0%	PID setpoint value of the equipment standard program.	**40204**	8192 = 100% maximum range of AI
SV4.7	PID F% = +0.0%	PID feedback value of the equipment standard program.	**40205**	8192 = 100% maximum range of AI

Parameter	Screen	Description	Address	Modbus Range
SV4.8	PID Error = +0.0%	Error value in PID mode.	**40203**	8192 = 100% maximum range of AI
SV4.9	Comparators: 000	Status of the three comparators.	**40232 → C1** **40233 → C2** **40234 → C3**	0 to 1
SV4.10	FLT.STAT.=NO FLT	Drive status before occurring the fault	**40559**	0 to 17 (See fault message list)
SV4.11	Fault Diag.=N	Fault diagnosis	**41601**	0 to 1
SV5.1	Local Sp = +100%	Speed reference in local mode.	**40124**	-20480 to 20480
SV5.2	PID Local = +100%	PID setpoint in local mode.	**40149**	0 to 32760
SV5.3	Mref 1 = +10.0%	Speed value assigned to Multi-reference 1.	**40052**	-20480 to 20480
SV5.4	Mref 2 = +20.0%	Speed value assigned to Multi-reference 2.	**40053**	-20480 to 20480
SV5.5	Mref 3 = +30.0%	Speed value assigned to Multi-reference 3.	**40054**	-20480 to 20480
SV5.6	Mref 4 = +40.0%	Speed value assigned to Multi-reference 4.	**40055**	-20480 to 20480
SV5.7	Mref 5 = +50.0%	Speed value assigned to Multi-reference 5.	**40056**	-20480 to 20480
SV5.8	Mref 6 = +60.0%	Speed value assigned to Multi-reference 6.	**40057**	-20480 to 20480
SV5.9	Mref 7 = +70.0%	Speed value assigned to Multi-reference 7.	**40058**	-20480 to 20480
SV5.10	Inch Spd1 = 0.00%	Inch speed 1.	**40092**	-20480 to 20480
SV5.11	Inch Spd2 = 0.00%	Inch speed 2.	**40093**	-20480 to 20480
SV5.12	Inch Spd3 = 0.00%	Inch speed 3.	**40094**	-20480 to 20480
SV5.13	PMP manSP=+0.0%	LOCAL manual speed reference.	**42042**	-20480 to 20480
SV5.14	PMP Mre1=0.0%	Local setpoint 1 of PID. Multi-reference 1.	**42151**	0 to 32760
SV5.15	PMP Mre2=0.0%	Local setpoint 2 of PID. Multi-reference 2.	**42152**	0 to 32760
SV5.16	PMP Mre3=0.0%	Local setpoint 3 of PID. Multi-reference 3.	**42153**	0 to 32760
SV5.17	PMP Mre4=0.0%	Local setpoint 4 of PID. Multi-reference 4.	**42154**	0 to 32760
SV5.18	PMP Mre5=0.0%	Local setpoint 5 of PID. Multi-reference 5.	**42155**	0 to 32760
SV5.19	PMP Mre6=0.0%	Local setpoint 6 of PID. Multi-reference 6.	**42156**	0 to 32760
SV5.20	PMP Mre7=0.0%	Local setpoint 7 of PID. Multi-reference 7.	**42157**	0 to 32760
SV5.21	PMP Mre8=0.0%	Local setpoint 8 of PID. Multi-reference 8.	**42158**	0 to 32760
SV5.22	T AutOFF=OFF	Time for Automatic Stop.	**42044**	0 to 999
SV5.23	TIME OFF=OFF	It shows the resting time in minutes for the automatic stopping of the system.	**42356**	0 to 6000
SV5.24	MAX flow=1000l/s	Level of maximum flow.	**42143**	0 to 32760
SV5.25	RESET LEVL=+100%	Reset level for the flow control algorithm.	**42145**	0 to 100
SV5.26	SLEP FLO=0.0l/s	Flow level to sleep the drive.	**42324**	0 to 32760
SV6.1	TOT= d h	Total time during which the drive is running (RUN).	**40550 → Days** **40551 → Hours**	Days → Real value = Modbus value Hours → 1 = 0.1 hours
SV6.2	PAR= d h	Partial time during which the drive is running (RUN).	**40552 → Days** **40553 → Hours**	Days → Real value = Modbus value Hours → 1 = 0.1 hours
SV6.3	CLEAR PARTIAL=N	To reset the counter of partial time for running status (RUN).	**40554**	0 to 1
SV6.4	TOTAL ENERGY	Total drive energy counter in kW	**41552**	0 to 999kW
SV6.4	TOTAL ENERGY	Total drive energy counter in MW	**41553**	1MW to 999MW
SV6.4	TOTAL ENERGY	Total drive energy counter in GW	**41554**	1GB to 5000GB
SV6.5.1	PARTIAL ENERGY	Partial drive energy counter in kW	**41556**	0 to 999kW
SV6.5.1	PARTIAL ENERGY	Partial drive energy counter in MW	**41557**	1MW to 999MW
SV6.5.1	PARTIAL ENERGY	Partial drive energy counter in GW	**41558**	1GB to 5000GB
SV6.5.2	RSET PRTL ENRG=N	Partial drive energy counter reset	**41559**	0 to 1

6. FAULT MESSAGES. DESCRIPTIONS AND ACTIONS

When a fault occurs the SD700 will stop the motor and show the generated fault on the display. You can display this fault in the programming line (lower line) while motor current and the speed values at the moment of the fault are displayed in the upper line.
It is possible to navigate through the additional display lines to access other status parameters without resetting the fault. These additional status parameters offer further information about the moment at which the fault occurred. Additionally, the FAULT led will blink and the fault message will be displayed until the fault is remedied and the drive is reset.

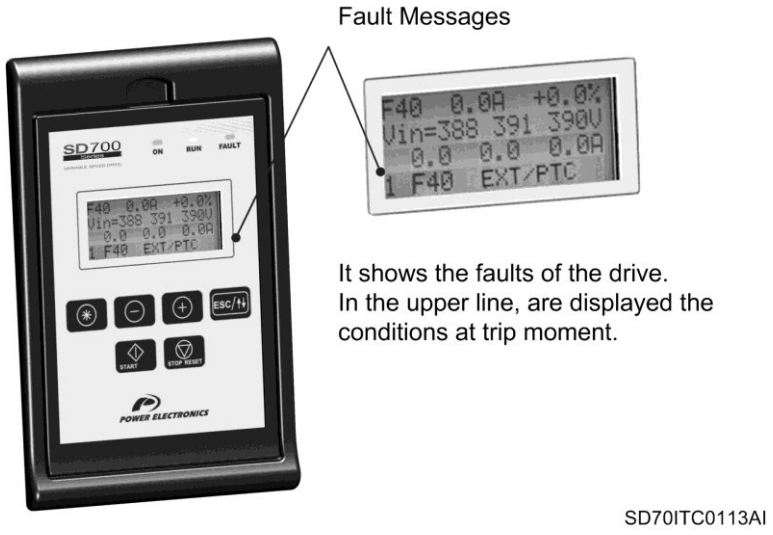

Figure 6.1 Fault displaying – Programming Line

6.1. Description of Fault List

DISPLAY	DESCRIPTION
F0 NO FAULT	Drive is operative. There is no fault.
F1 I LIM FLT	Output current has reached a dangerous level. Its value is above 220% of the drive rated current. Protection is activated instantaneously.
F2 V LIM FLT	DC Bus voltage has reached a dangerous level >850VDC. Hardware Protection. Drive will turn off the output to the motor.
F3 PDINT FLT	DC Bus voltage and the output current of the equipment have reached dangerous levels.
F4 OVERLOAD U+	Internal protection within the appropriate IGBT semiconductor has acted.
F5 OVERLOAD U-	
F6 OVERLOAD V+	
F7 OVERLOAD V-	
F8 OVERLOAD W+	
F9 OVERLOAD W-	
F10 SAFE STOP	Automatic internal protection of several of the IGBT semiconductors has acted or safe stop contact of the drive (connected to an external circuit by the user) has been activated (for example, emergency stop).
F11 VIN LOSS	Power supply loss of any input phase for a time higher than 20ms has occurred.
F12 IMB V IN	Input voltage imbalance greater than ±10% of average input power supply of SD700 for a time higher than 100ms.
F13 HI V IN	Average supply voltage has exceeded the value set in 'G11.6 HIGH VOLT' for greater than the time set in 'G11.7 HIGH V TO'.
F14 LW V IN	Average supply voltage is lower than the value set in 'G11.4 LOW VOLT' for greater than the time set in 'G11.5 LOW V TO'.
F15 CURL Vdc	Unstable bus voltage. There is a DC Bus voltage ripple higher than 100VDC for more than 1.1sec.
F16 HI Vdc	DC Bus voltage has exceeded critical operating level (>850VDC). Software Protection.
F17 LW Vdc	DC Bus voltage is lower than critical operating level (<350VDC).

DISPLAY	DESCRIPTION
F18 IMB V OUT	Voltage imbalance of more than ±5% of the average drive output average voltage for a time higher than 100ms.
F19 IMB I OUT	Current imbalance of more than ±25% of the average output motor current for a time higher than 1s.
F20 GROUND FLT	Current level to the ground has exceeded the level set in 'G11.3 GND I LIMT'.
F21 I LIM T/O	Motor current has exceeded the current limit set in 'G10.5 I LIMIT' for the time set in 'G10.6 I LIM TO'.
F22 TQ LIM T/O	Motor torque has exceeded the torque limit set in parameter 'G10.7 MAX TOR' for the time set in 'G10.8 T LIMT TO'.
F23 Min Spd Lm	Motor speed does not reach the speed limit (parameters G10.1 to G10.4) for the time set in 'G11.21 SP Min. T'.
F25 MTR O/L	Motor overload calculated by SD700 thermal model has exceeded 110%.
F27 DL SMTH	DC Bus has not charged in the expected time.
F28 Ir.LIM TO	Motor load current has exceeded the regenerating current limit set in 'G10.12 ILIM RGN' for the time set in 'G10.13 Ilim_rgnTO'.
F29 DSP FLT	DSP has detected wrong data.
F30 WATCHDOG	An unknown fault has reset the microprocessor of the control board.
F31 SCR L1	Trip on conduction status of thyristor 1. The thyristor has not turned on correctly.
F32 SCR L2	Trip on conduction status of thyristor 2. The thyristor has not turned on correctly.
F33 SCR L3	Trip on conduction status of thyristor 3. The thyristor has not turned on correctly.
F34 IGBT TEMP	IGBT internal temperature has reached a level of 110°C (See parameter SV2.4).
F35 PHS L1 LOS	Input phase L1 is not present. Phase fault.
F36 PHS L2 LOS	Input phase L2 is not present. Phase fault.
F37 PHS L3 LOS	Input phase L3 is not present. Phase fault.
F38 ENCOD LOST	Incorrect reading made by the encoder working in closed loop.
F40 EXT / PTC	External trip device or motor PTC has operated (terminals 8 and 9). Values lower than 90Ω ±10% or higher than 1K5 ± 10% generate the fault.
F41 COMMS TRIP	Trip generated through RS232 or RS485 communication. Master (PLC or PC) is generating a fault in the SD700 through serial communication.
F42 AIN1 LOSS	The SD700 is not receiving a signal on analogue input 1 and 'G4.2.14 AIN1 LOSS' is set to 'Yes'. The signal connected to this input has been lost.
F43 AIN2 LOSS	The SD700 is not receiving a signal on the analogue input 2 and 'G4.3.14 AIN2 LOSS' is set to 'Yes'. The signal connected to this input has been lost.
F44 CAL FLT	Internal reference voltage levels are wrong.
F45 STOP T/O	Trip generated due to excessive stopping time. The elapsed time from stop signal activation has exceeded the value set in parameter 'G11.2 STOP TO'.
F46 EEPROM FLT	Non-volatile memory (EEPROM) is faulty.
F47 COMMS T/O	Trip generated due to excessive delay of serial communication. The elapsed time from the last valid data transmission has exceeded the time set in parameter 'G20.2 COMMS T/O'.
F48 SPI COM	Trip because data bus transfer is wrong.
F49 SPD LIMIT MAX	Motor speed has exceeded the speed limit (parameters G10.1 to G10.4) for the time set in 'G11.1 SP LIM TO'.
F50 PSU FAULT	Internal power supply is not supplying the correct voltage. One voltage level has decreased to zero value for 100ms approx.
F51 SCR TEMP	Rectifier heat sink temperature has reached a dangerous level.
F52 FAN P.SUPP	A fault in the power supply to the cooling fans has occurred.
F53 INTRNL TEMP	Internal temperature of the SD700 control electronics chamber has reached a dangerous level.
F54 WATCHDOG	Internal fault of the microcontroller.
F55 DO Feedbck	The digital input configured as "Dig Output FB" has not received the feedback of the digital output set in parameter G8.1.34 before the time configured in parameter G8.1.35.
F56 EMERG.STOP	Digital input configured as 'EXTERN EMERGE' has been activated (NC contact).
F57 PUMP OvLd	This fault is generated when the output current of the drive is higher than the current set in 'G11.11 PUMP OV' during the time adjusted in 'G11.13 Povl DLY'.
F58 PROFI.TOUT	Once the Profibus Master has configured the drive as Profibus Slave, and after establishing the connection, which is always permanent, if the communication is cut off, the drive trips by Timeout fault.
F60 EIP/DN T.O	The connection between the drive (server) and the Ethernet/IP Client (PLC) has been lost. If there is not a configuration to indicate the contrary, the CIP standard forces the drive to stop the motor and to trip because of Timeout fault.
F61 NO INPUT V	This fault will be shown in the display of the SD700 when the start command is activated and the input voltage applied to the drive is lost, and the drive is powered by the External 24V Power Supply.
F73 FLT COMP 1	Failure of the comparator 1
F74 FLT COMP 2	Failure of the comparator 2
F75 FLT COMP 3	Failure of the comparator 3
F76 SLAVE O.F	The master of the optical fiber network shows this fault if one of their slaves fails.
F77 OPT FIB TO	Timeout of the optical fiber has been exceeded.
F78 TMP FREMAQ	Temperature of the filter has reached a dangerous value.

6.2. Procedure for Fault Solutions

DISPLAY	POSSIBLE CAUSE	ACTIONS
F0 NO FAULT		
F1 I LIM FLT	Motor output short circuit: Wiring fault. Circuit fault. Motor fault.	Check output cables and motor for possible wiring faults or short circuits.
F2 V LIM FLT	High voltage peak on the input. High load regeneration. Deceleration ramp too high (parameters 'G5.2 DECEL1' and 'G5.4 DECEL2').	Check conditions of input power supply. Decrease deceleration ramps.
F3 PDINT FLT	See faults F1 and F2.	See faults F1 and F2.
F4 OVERLOAD U+ F5 OVERLOAD U- F6 OVERLOAD V+ F7 OVERLOAD V- F8 OVERLOAD W+ F9 OVERLOAD W-	Short circuit. Extreme over current, equipment overload. Wiring fault; circuit fault. Desaturation of IGBT; IGBT fault.	Check if there are possible wiring faults or a motor fault. If the fault persists after disconnecting output wires request technical assistance.
F10 SAFE STOP	See possible causes for faults F4 – F9. Safe stop contact of the drive has been activated.	See actions for F4 – F9. Revise the external circuit, where the safe stop contact is connected, that produces the activation of this contact into the drive.
F11 VIN LOSS	Input power is incorrect, damaged fuses. Input wiring is incorrect.	Check conditions of input power supply. Check wiring.
F12 IMB V IN	Input power is incorrect, damaged fuses. Input wiring is incorrect.	Check conditions of input power supply. Check wiring.
F13 HI V IN	Input power is incorrect. Incorrect setting of parameter 'G11.6 HIGH VOLT'.	Check input power conditions. Check parameters settings.
F14 LW V IN	Input power is incorrect, damaged fuses. Incorrect setting of parameter 'G11.4 LOW VOLT'.	Check input power conditions. Check parameters settings.
F15 CURL Vdc	Input power is incorrect. Motor is driving an unstable load. One of the input fuses is damaged.	Check input power conditions, load type of the application, and all of the motor mechanical parts. If the fault persists after disconnecting output wires, request technical assistance.
F16 HI Vdc	High voltage peak on the input. High load regeneration. Deceleration ramp too high (parameters 'G5.2 DECEL1' and 'G5.4 DECEL2').	Check conditions of input power supply. Check stop conditions of the drive. Decrease deceleration ramps.
F17 LW Vdc	Input power is wrong, damaged fuses.	Check conditions of input power supply.
F18 IMB V OUT	Motor is driving an unstable load. Motor wiring fault. Motor is wrong.	Check motor circuit completely in case of possible wiring faults or motor fault. If the fault persists after disconnecting output wires, request technical assistance.
F19 IMB I OUT	Motor is supporting unstable loads. Motor wiring fault. Motor is wrong.	Check motor circuit completely in case of possible wiring faults or motor fault.
F20 GROUND FLT	Motor or wiring has short-circuited to ground. Ground is incorrectly connected or wrong.	Disconnect the motor and wiring of the SD700 and check motor insulation. Check and improve the ground connection system.
F21 I LIM T/O	Motor stalled. Heavy load. Motor mechanical brake is coupled.	Check the motor load. Increase maximum current limit.
F22 TQ LIM T/O	Motor stalled. Heavy load. Motor mechanical brake is coupled.	Check the motor load. Increase maximum torque limit.
F23 Min Spd Lm	Speed reference is lower or equal than the speed limit. Motor speed is out of control or motor is not accelerating due to the load.	Check the reference source and the motor load. Verify speed limits.

ENGLISH

DISPLAY	POSSIBLE CAUSE	ACTIONS
F25 MTR O/L	High current used by the motor due to heavy load.	Check the motor load. Check the setting of parameters 'G2.1 MTR CUR' and 'G2.7 MTR COOL' relating to the motor thermal model. Increasing the parameter 'G2.7 MTR COOL', can be undertaken when there is a motor PTC fitted and it is connected to the SD700.
	The load exceeds the capacity of motor cooling under normal operating conditions.	
	Incorrect setting of the thermal model parameters.	
	Phase loss of the motor or a fault in motor windings.	
F27 DL SMTH	Potential damage to the soft charge resistors of the SD700.	Try to reset the fault. Disconnect and re-connect again the input power. If the fault persists contact Power Electronics for technical service.
F28 Ir.LIM TO	Excessive regeneration is produced due to deceleration ramp to high.	Decrease deceleration ramp. Revise the setting of parameters related to regenerating current limitation (G10.12 and G10.13).
F29 DSP FLT	Input power fault.	Disconnect and connect again SD700 input power. If the same fault appears, initialize all of the parameters (parameter 'G1.5 INITIALISE') and connect the input power again. If the fault persists, request technical assistance.
	Parameter setting is incoherent.	
F30 WATCHDOG	Input power fault.	Reset the fault; If the fault persists, request technical assistance.
F31 SCR L1	A conduction fault has been produced in the corresponding thyristor. The thyristor is OFF when it should be on.	Try to reset the fault. Disconnect and re-connect again the input power. If the fault persists request technical assistance.
F32 SCR L2		
F33 SCR L3		
F34 IGBT TEMP	Blocked or poor ventilation.	Check if there is an object blocking ventilation. Improve the cooling.
	Heat sink and cooling fan fault on the SD700.	Check if the heat sink and the cooling fan are operating correctly.
	Ambient temperature is higher than 50°C.	Check the cooling and thermal conditions. Request technical assistance.
F35 PHS L1 LOS	Input phase L1 is not connected correctly or there is no voltage on it.	Verify the wiring of the input power supply of the drive. Check input voltage and input fuses.
F36 PHS L2 LOS	Input phase L2 is not connected correctly or there is no voltage in it.	
F37 PHS L3 LOS	Input phase L3 is not connected correctly or there is no voltage in it.	
F38 ENCOD LOST	Incorrect reading made by the encoder	Check the encoder wiring and its power supply
F40 EXT / PTC	External trip device has operated.	Check the external trip switch (if exists).
	Motor is overheated (motor load exceeds the cooling capacity at operating speed).	Check motor temperature. To reset the fault the motor must be return to normal temperature.
	Fault in sensor connection.	Check sensor wiring.
F41 COMMS TRIP	Trip generated by a computer through serial communication.	Disconnect the SD700 from the communication network and verify if the fault is generated again.
F42 AIN1 LOSS	Analogue input cable has been come loose or disconnected (terminals 10 and 11).	Verify the wiring and the device which provides the analogue signal.
F43 AIN2 LOSS	Analogue input cable has been come loose or disconnected (T12 and T13).	Verify the wiring and the device which provides the analogue signal.
F44 CAL FLT	SD700 fault.	Verify drive select. Request technical assistance.
F45 STOP T/O	Deceleration ramps (parameters 'G5.2 DECEL1' and 'G5.4 DECEL2') are too slow.	Verify that the time set in parameter 'G11.2 STOP TO' to stop the system after setting deceleration ramps and checking the system performance.
	SD700 is voltage limiting voltage due to regeneration from the motor.	
F46 EEPROM FLT	Integrated circuit fault.	Request technical assistance.
F47 COMMS T/O	Communications cable has been come loose or cut.	Verify the wiring of communications system.
	Master device has not sent valid data in the required frame or it has sent incorrect data.	Verify the data and settings of the master device.
F48 SPI COM	Input power fault.	Reset the equipment and if the fault persists request technical assistance.

DISPLAY	POSSIBLE CAUSE	ACTIONS
F49 SPD LIMIT MAX	Speed reference is higher or equal than the speed limit.	Check the reference source and the motor load.
	Motor speed is out of control or motor is accelerating because of the load.	Verify speed limits.
F50 PSU FAULT	Damaged power supply.	Reset the equipment and if the fault persists request technical assistance.
F51 SCR TEMP	Temperature limits for SD700 rectifier have been exceeded.	Verify that the ambient conditions are proper for the equipment. Be sure that there is nothing obstructing the cooling fans (dust, papers, dirt, etc) and that these rotate correctly.
F52 FAN P.SUPP	Fans of the equipment are operating wrong.	Verify that fans are not obstructed. Check that fans are not dirty and rotate correctly.
	Power supply of the fans has been overheated.	Wait for the temperature of the power supply decreases down to a value in normal conditions and restart it. You can disconnect the equipment, connect it again, and restart the power supply again. If the fault persists request technical assistance of Power Electronics.
F53 INTRNL TEMP	The limit of internal temperature of the electronics chamber has been exceeded.	Verify that the ambient conditions are proper for the equipment. Be sure that there is nothing obstructing the cooling fans (dust, papers, dirt in general) and that these rotate correctly.
F54 WATCHDOG	A fault in the microcontroller has occurred.	Disconnect and re-connect the input power of the drive. If the fault persists request technical assistance of Power Electronics.
F55 DO Feedbck	Timeout of the parameter G8.1.35 has been exceeded.	Check the feedback of the digital output configured in the parameter G8.1.34.
F56 EMERG.STOP	An external trip has been produced by closing a contact on the digital input configured in this option.	Verify the wiring of digital input. Check the installation.
F57 PUMP OvLd	High current used by the motor due to heavy load.	Check the motor load. Check if the motor cooling is appropriate. Check the setting of the parameters related to pump overload in group G11.
	The load exceeds the capacity of the motor cooling under normal operating conditions.	
	Incorrect setting of the parameters related to pump overload.	
	Phase loss of the motor or a fault in motor windings.	
F58 PROFI.TOUT	The communication between Profibus Master and Slave is cut off.	Revise the Profibus wiring and the configuration in the Master (PLC).
F60 EIP/DN T.O	The active connection with the Ethernet/IP Client has been lost.	Check the Ethernet/IP connection of the client (PLC, PC).
F61 NO INPUT V	The start command has been given while the drive is powered through the External 24V Power Supply.	Restore 3-Phase power supply to the drive before giving the start command.
F73 FLT COMP 1	The comparator 1 has been disabled.	Check the configuration of the comparator 1.
F74 FLT COMP 2	The comparator 2 has been disabled.	Check the configuration of the comparator 2.
F75 FLT COMP 3	The comparator 3 has been disabled.	Check the configuration of the comparator 3.
F76 SLAVE O.F	Failure of a slave.	Check the slave status.
F77OPT FIB TO	The fiber is broken.	Check wiring. Check the equipment status.
	One of the equipments of the network is turned off.	
	Improper connection.	
F78 TMP FREEMAQ	The temperature of the filter is very high.	Check the ventilation. Check the thermal contacts. Check the power contactor Check the wiring to the digital input configured as “FREMAQ FLT”.

7. COMMONLY USED CONFIGURATIONS

7.1. Start / Stop Commands and Speed Reference by Keypad

7.1.1. Parameters Configuration

Parameter	Name / Description	Value
G1: Options Menu.		
4 LANG=ENGLISH	**G1.4** / Language selection	ENGLISH
7 PROG = STANDARD	**G1.7** / Program activation	STANDARD
G2: Motor Nameplate.		
1 MTR CURR=00.00A	**G2.1** / Motor rated current	__A (Set according to motor nameplate).
2 MTR VOLT=400V	**G2.2** / Motor rated voltage	__V (Set according to motor nameplate).
3 MTR PWR=00.0kW	**G2.3** / Motor rated power	__kW (Set according to motor nameplate).
4 MTR RPM=1450	**G2.4** / Motor rpm	__rpm (Set according to motor nameplate).
5 MTR PFA=0.84	**G2.5** / Cosine Phi	__ (Set according to motor nameplate).
6 MTR FRQ=50Hz	**G2.6** / Motor frequency	__Hz (Set according to motor nameplate).
7 MTR COOL=63%	**G2.7** / Motor cooling at zero speed	Use the following values as a reference: Submersible pumps and non-deflagrating motors ➔ 5% Self-cool motor ➔ 63% Force-cooled motor ➔ 100%
G3: References.		
1 REF1 SPD=LOCAL	**G3.1** / Speed reference source 1	LOCAL ➔ Reference will be determined by keypad and is set in G3.3 'Local Speed Reference'.
3 LOCAL SPD=+100%	**G3.3** / Local Speed Reference	100%
G4: Inputs – S4.1: Digital Inputs.		
1 CNTROL MODE1=1	**G4.1.1** / Main Control Mode	1 ➔ LOCAL (Drive control is done by keypad).
3 RESET MODE=Y	**G4.1.3** / Reset by keypad	Y ➔ YES (Enables reset by keypad).

7.2. Start / Stop Commands by Terminals and Speed Reference by Analogue Input

7.2.1. Parameters Configuration

2 MTR VOLT=400V	**G2.2** / Motor rated voltage	__V (Set according to motor nameplate).
3 MTR PWR=00.0kW	**G2.3** / Motor rated power	__kW (Set according to motor nameplate).
4 MTR RPM=1485	**G2.4** / Motor rpm	__rpm (Set according to motor nameplate).
5 MTR PFA=0.85	**G2.5** / Cosine Phi	__ (Set according to motor nameplate).
6 MTR FRQ=50Hz	**G2.6** / Motor frequency	__Hz (Set according to motor nameplate).
7 MTR COOL=63%	**G2.7** / Motor cooling at zero speed	Use the following values as a reference: Submersible pumps and non-deflagrating motors ➔ 5% Self-cool motor ➔ 63% Force-cooled motor ➔ 100%
G3: References.		
1 REF1 SPD=LOCAL	**G3.1** / Speed reference source 1	LOCAL ➔ Reference will be introduced by keypad and is set in G3.3 'Local Speed Reference'.
2 REF2 SPD=LOCAL	**G3.2** / Speed reference source 2	AI1 ➔ Reference will be introduced by Analogue Input 1.
3 LOCAL SPD=+100%	**G3.3** / Local Speed Reference	+100%

Parameter	Name / Description	Value
G4: Inputs – S4.1: Digital Inputs.		
1 CNTROL MODE1=2	**G4.1.1** / Main Control Mode	2 ➔ REMOTE (Drive control is done through control terminals).
4 DIGIT I MODE=1	**G4.1.4** / Digital Inputs configuration selection	1 ➔ ALL PROGRAMMABLE (all digital inputs can be individually configured by the user).
5 DIGITL IN 1=05	**G4.1.5** / Multi-function Digital Input 1 configuration	05 ➔ Start/Stop (Allows the start/stop command to be given by a switch).
6 DIGITL IN 2=15	**G4.1.6** / Multi-function Digital Input 2 configuration	15 ➔ Reference 2 (It allows selecting the alternative speed reference programmed in G3.2.)

7.2.2. Connections drawing

Terminals 1 and 2: start / stop command (NO status).
Terminals 1 and 3: alternative reference command (NO status).

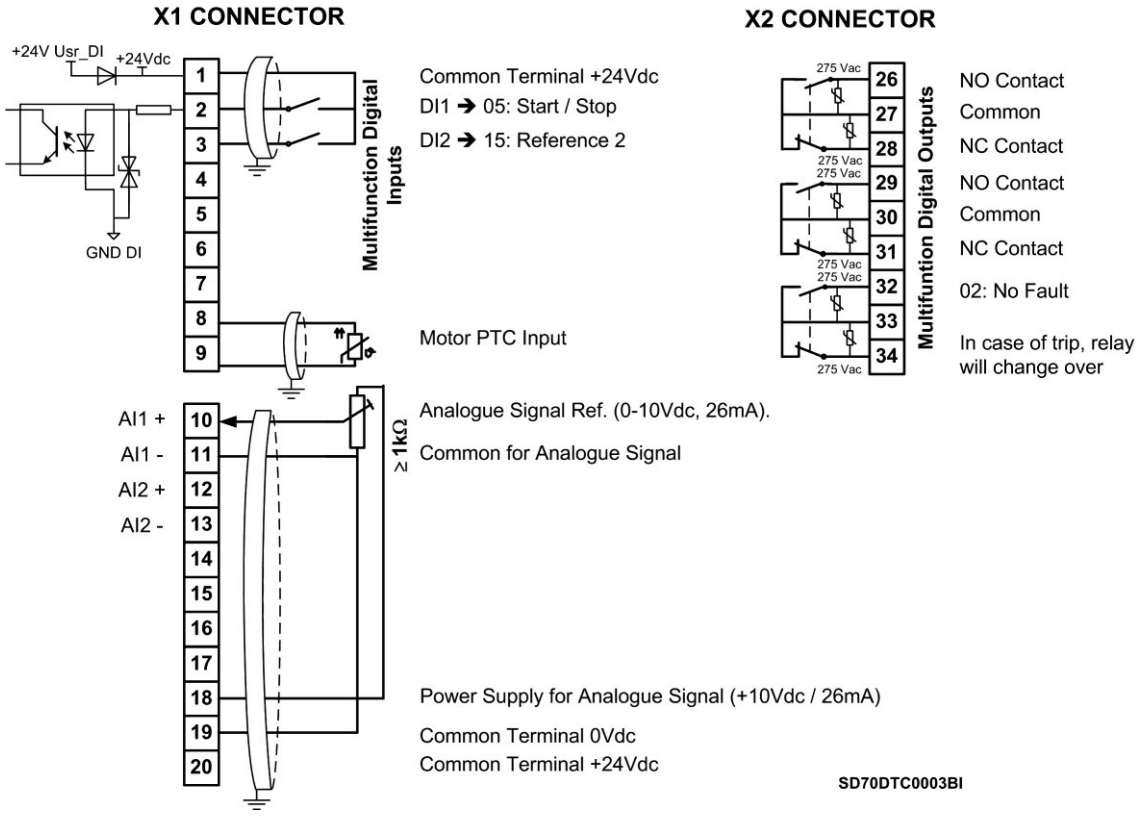

Figure 7.1 Start / Stop commands by terminals and speed reference by analogue input

Note: Use screened cables for the controls and connect screen to ground.

ENGLISH

7.3. Start / Stop Commands by Terminals and Speed Reference by Motorized Potentiometer

7.3.1. Parameters Configuration

Parameter	Name / Description	Value
G1: Options Menu.		
4 LANG=ENGLISH	**G1.4** / Language selection	ENGLISH
7 PROG = STANDARD	**G1.7** / Program activation	STANDARD
G2: Motor Nameplate.		
1 MTR CURR=00.00A	**G2.1** / Motor rated current	__A (Set according to motor nameplate).
2 MTR VOLT=400V	**G2.2** / Motor rated voltage	__V (Set according to motor nameplate).
3 MTR PWR=00.0kW	**G2.3** / Motor rated power	__kW (Set according to motor nameplate).
4 MTR RPM=1485	**G2.4** / Motor rpm	__rpm (Set according to motor nameplate).
5 MTR PFA=0.85	**G2.5** / Cosine Phi	__ (Set according to motor nameplate).
6 MTR FRQ=50Hz	**G2.6** / Motor frequency	__Hz (Set according to motor nameplate).
7 MTR COOL=63%	**G2.7** / Motor cooling at zero speed	Use the following values as a reference: Submersible pumps and non-deflagrating motors ➔ 5% Self-cool motor ➔ 63% Force-cooled motor ➔ 100%
G3: References.		
1 REF1 SPD=PMOT	**G3.1** / Speed reference source 1	PMOT ➔ Motorized potentiometer with or without reference memory.
G4: Inputs – S4.1: Digital Inputs.		
1 CNTROL MODE1=2	**G4.1.1** / Main Control Mode	2 ➔ REMOTE (Drive control is done through control terminals).
4 DIGIT I MODE=1	**G4.1.4** / Digital Inputs configuration selection	4 ➔ MOTORIZED POT (It assigns the function of up and down speed reference to two of the digital inputs. DI5 = Up (NO Contact) and DI6 = Down (NC Contact). Reference is memorized) 5 ➔ ERASAB POT (As per above mode without memorizing the reference).
5 DIGITL IN 1=05	**G4.1.5** / Multi-function Digital Input 1 configuration	05 ➔ Start/Stop (Allows the start/stop command to be given by a switch).
G5: Inputs: Acceleration and Deceleration Ramps.		
7 PMT ACL1=1.0% / s	**G5.7** / Ramp 1 of reference increase for motorized potentiometer	1.0% / s (Modify these ramps to tune operation). If the ramp is increased the speed reference response will be faster. If the ramp is decreased the speed reference response will be slower.
8 PMT DCL1=3.0% / s	**G5.8** / Ramp 1 of reference decrease for motorized potentiometer	3.0% / s (Modify these ramps to tune operation). If the ramp is increased the speed reference response will be faster. If the ramp is decreased the speed reference response will be slower.

7.3.2. Connections Drawing

Terminals 1 and 2: start / stop command (NO status).
Terminals 1 and 6: up speed command (NO status).
Terminals 1 and 7: down speed command (NC status).

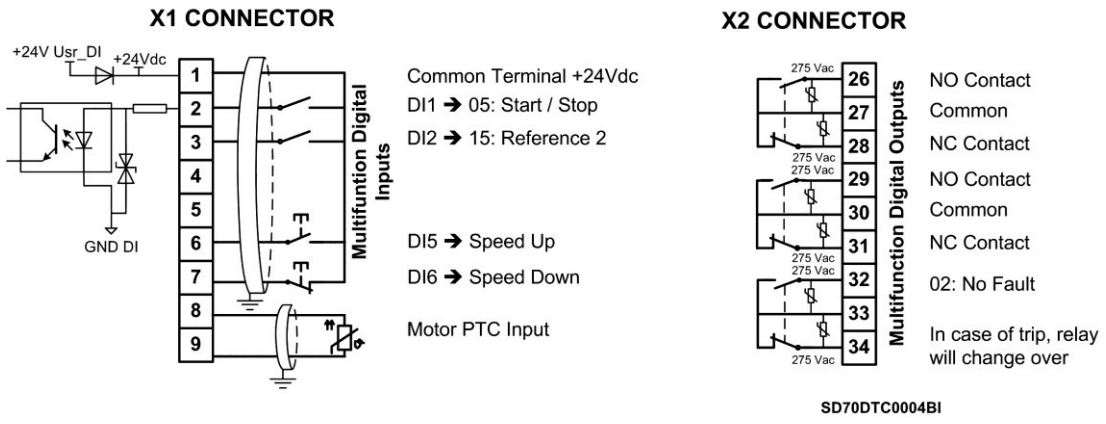

Figure 7.2 Start / Stop commands by terminals and speed reference by motorized potentiometer
